

## LSST: science, status and opportunities

Željko Ivezić, LSST Project Scientist Department of Astronomy, University of Washington Moscow State University, February 9, 2012

# Context: modern observational methods in astronomy and astrophysics:

 Large telescopes (~10m): faint objects, especially spectroscopy

The Keck telescopes on Mauna Kea (Hawaii)

# Context: modern observational methods in astronomy and astrophysics:

• Telescopes above the atmosphere: high angular resolution (e.g., the Hubble Space Telescope) and other wavelength regions (X-ray, radio, infrared)

#### The HST in orbit and an example of a galaxy image

Context: modern observational methods in astronomy and astrophysics:

- Large telescopes (~10m): faint objects, especially spectroscopy
- Telescopes above the atmosphere: high angular resolution (e.g., the Hubble Space Telescope) and other wavelength regions (X-ray, radio, infrared)
- Large sky surveys: digital sensor technology, information technology, automated data processing and data distribution

Key point: modern sky surveys make all their data (images and catalogs) publicly available

# Why are sky maps useful?

# • Sky map:

- a list of all detected objects (stars, galaxies, ...)

measured parameters (size, color, brightness,...)

# • The utility of sky maps:

Discoveries of new objects: "Is this a new asteroid, or is it already cataloged?"

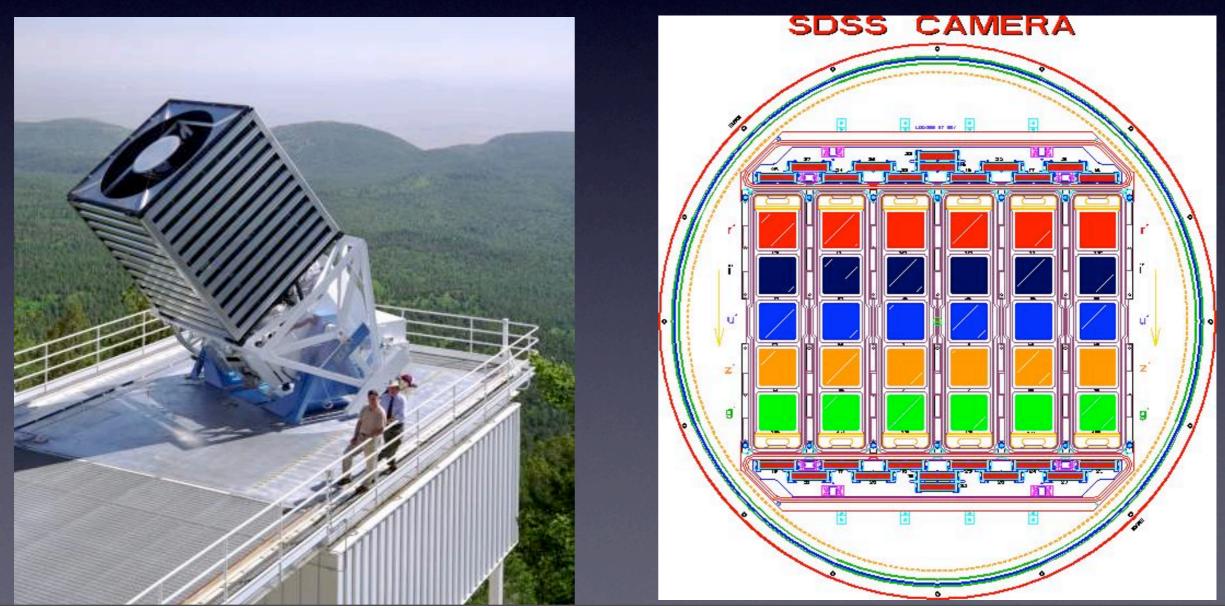

Object classification: "What types of galaxies exist?" Statistical population studies: "Do quasars change their properties with time?"

Search for unusual objects: "Is this star very weird?" Cosmological measurements: "How fast does the Universe expand?"

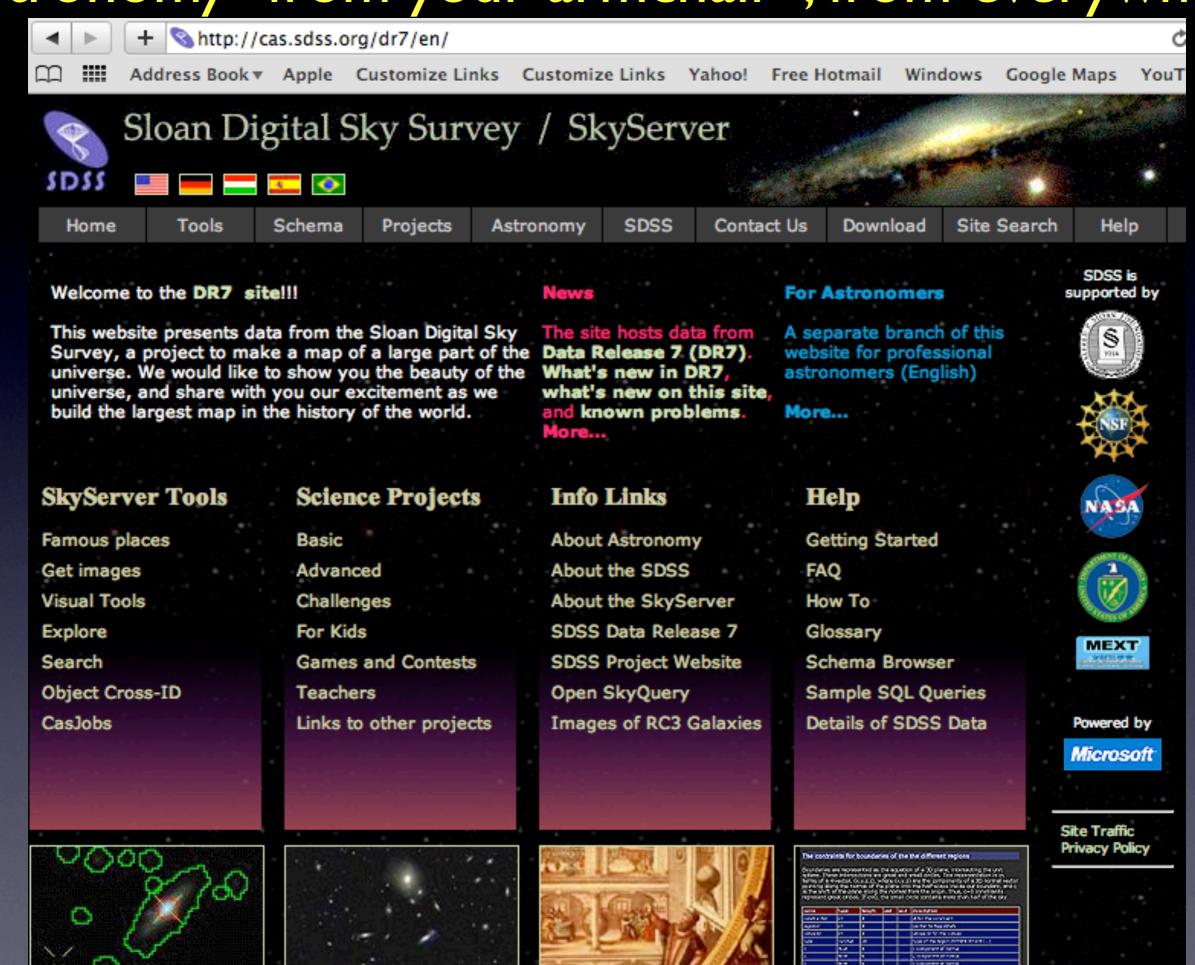

"Science-ready database": measurements can be (simply) analyzed without the need for (complex) image processing

# The last decade: Sloan Digital Sky Survey

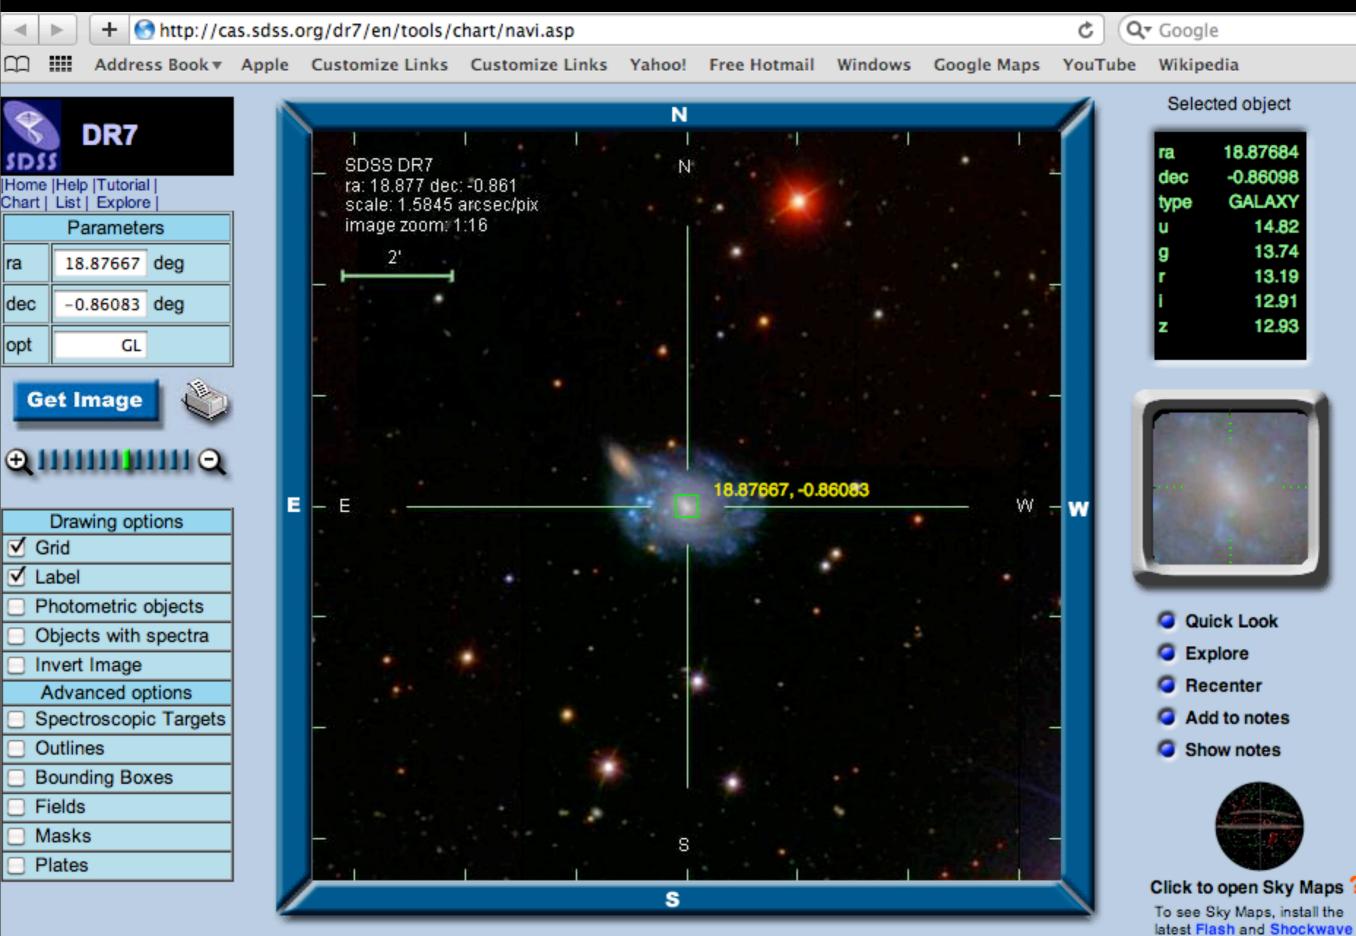

- Digital sky survey with a 120 Megapix CCD camera
- Precise measurements for 400,000,000 objects
- Revolution in astronomy: public databases

#### Astronomy "from your armchair", from everywhere

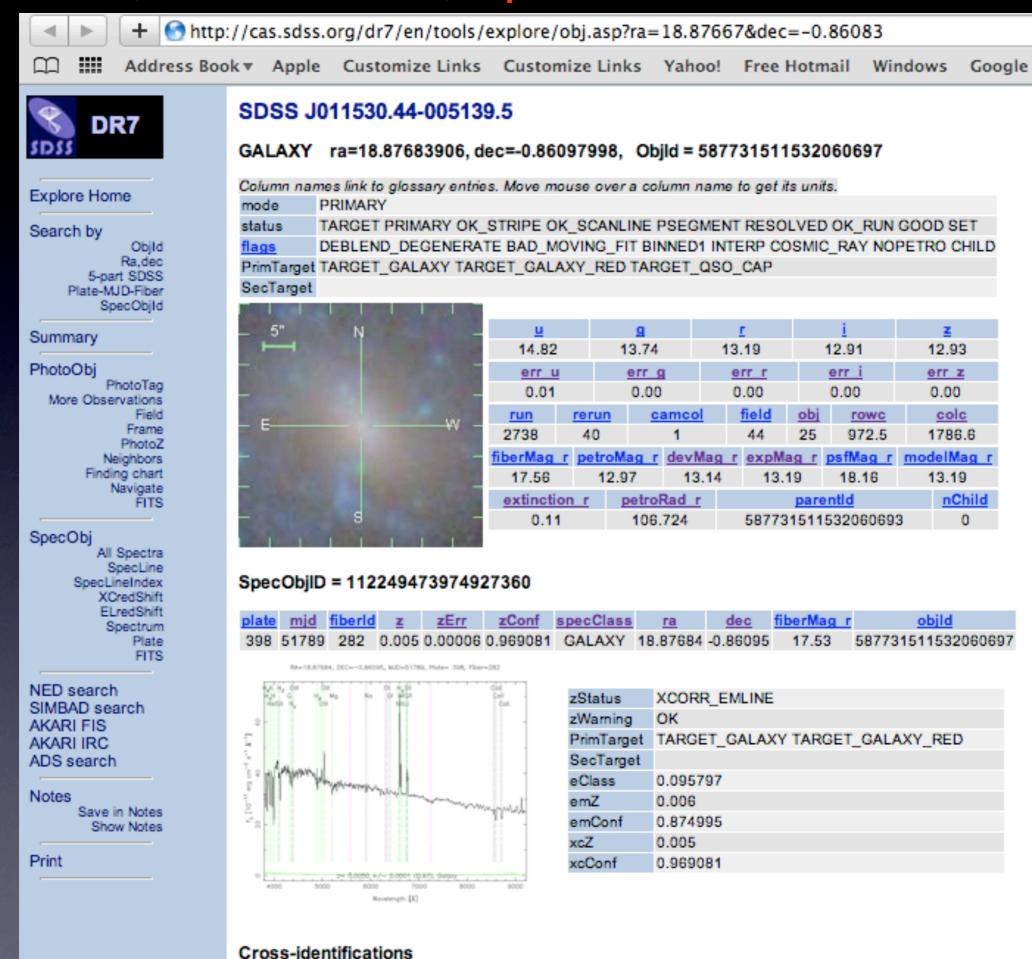

#### "Navigation" around the sky...

players.

#### Additional, more detailed, information...

#### Additional, more detailed, information...

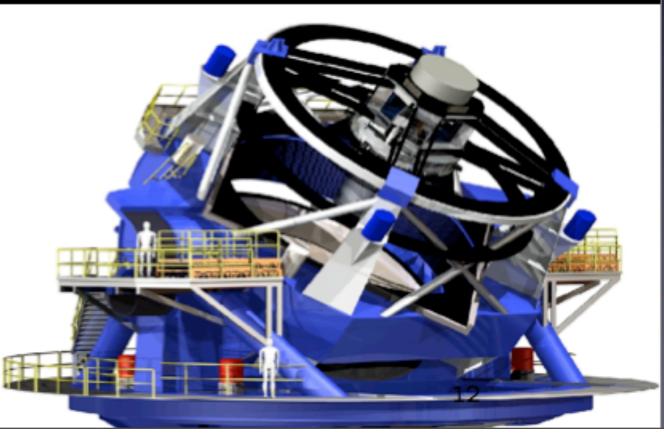

SDSS: one US Library of Congress worth of data LSST: one SDSS per night, or all the words ever printed!

#### Outline

# • LSST system summary

- o Science Themes
- o System Characteristics

# • LSST science examples

o Extragalactic astronomy and cosmology o The Milky Way and the Local Group o Time Domain

# Opportunities for collaboration

- o Construction
- o Operations
- o Science Collaborations

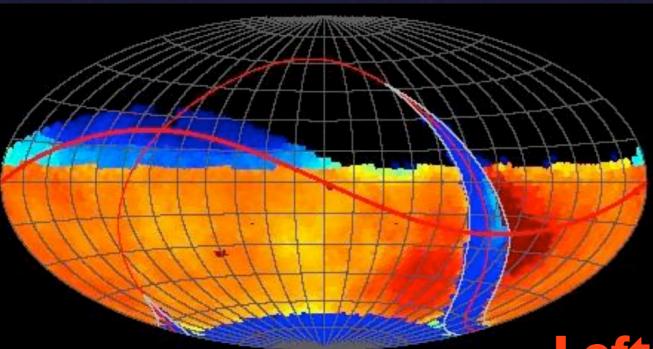

## **LSST Science Themes**

- Dark matter, dark energy, cosmology (spatial distribution of galaxies, gravitational lensing, supernovae, quasars)
- Time domain (cosmic explosions, variable stars)
- The Solar System structure (asteroids)
- The Milky Way structure (stars)

These drivers not only require similar hardware and software systems, but also motivate a uniform cadence: **about 90% of time will be spent on a uniform survey** 

# Basic idea behind LSST: a uniform sky survey

- 90% of time will be spent on a uniform survey: every 3-4 nights, the whole observable sky will be scanned twice per night
- after 10 years, half of the sky will be imaged about 1000 times (in 6 bandpasses, ugrizy): a digital color movie of the sky
- ~100 PB of data: about a billion 16 Mpix images, enabling measurements for 20 billion objects

100

acquired number of visits: r

200

150

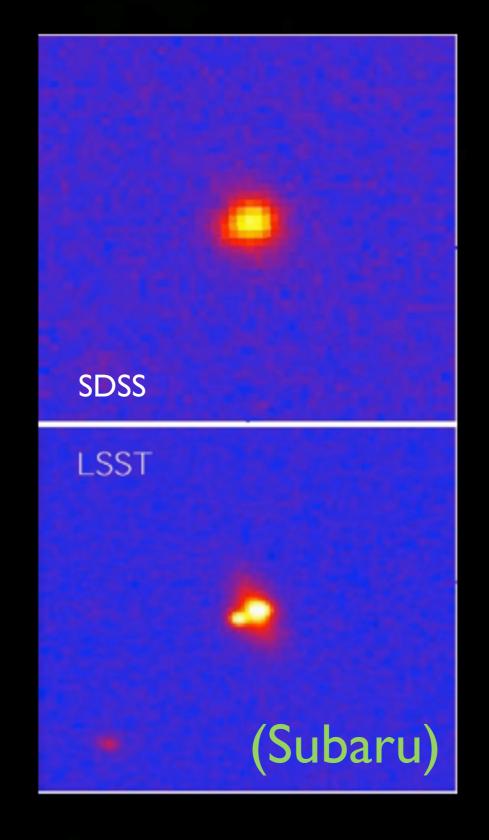

#### LSST in one sentence:

An optical/near-IR survey of half the sky in ugrizy bands to r~27.5 (36 nJy) based on 1000 visits over a 10-year period: deep wide fast.

Left: a 10-year simulation of LSST survey: the number of visits in the r band (Aitoff projection of eq. coordinates)

#### SDSS-LSST comparison: LSST=d(SDSS)/dt, LSST=SuperSDSS 3x3 arcmin, gri

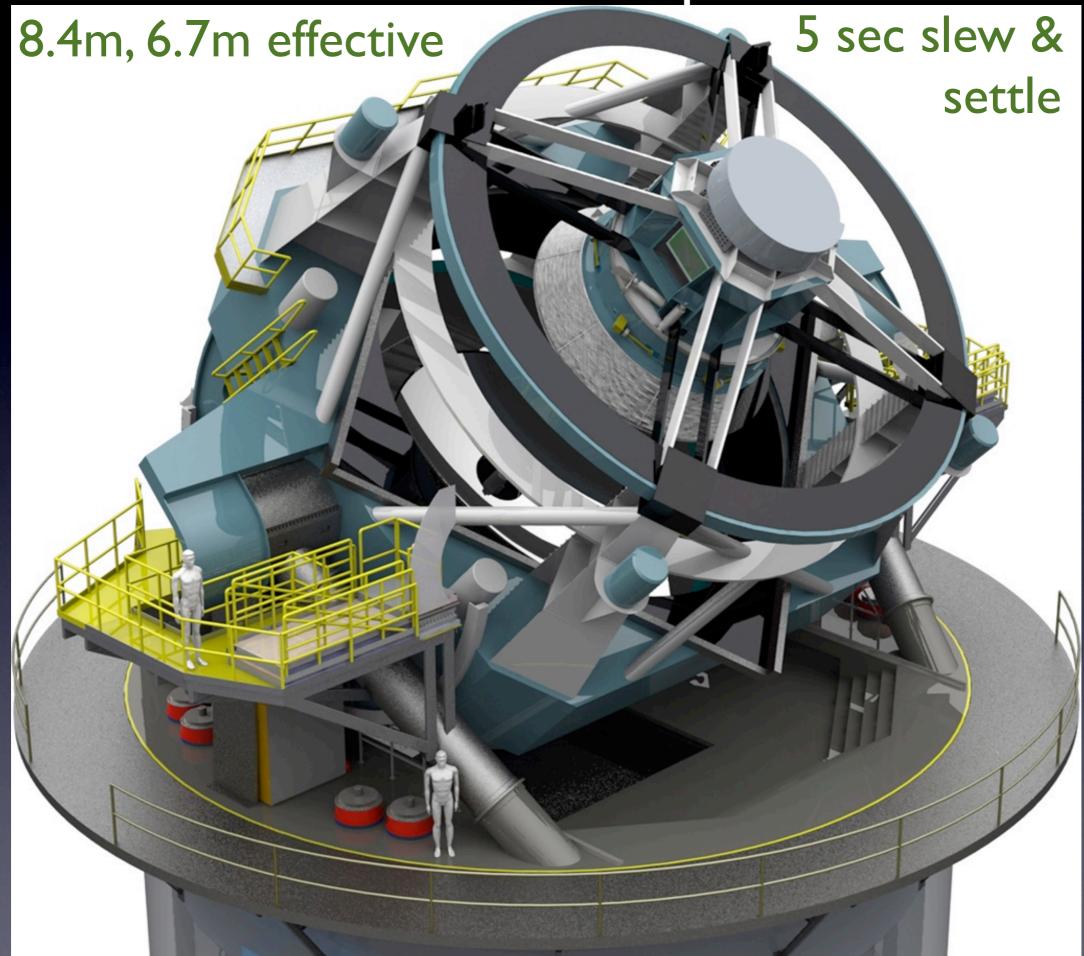

#### **Required system characteristics**

- Large primary mirror (at least 6m) to go faint and to enable short exposures (30 s)
- Agile telescope (5 sec for slew and settle)
- Large field of view to enable fast surveying
- Impeccable image quality (weak lensing)
- Camera with 3200 Mpix
- Sophisticated software (20,000 GB/night, 20 billion objects, 20 trillion measurements)

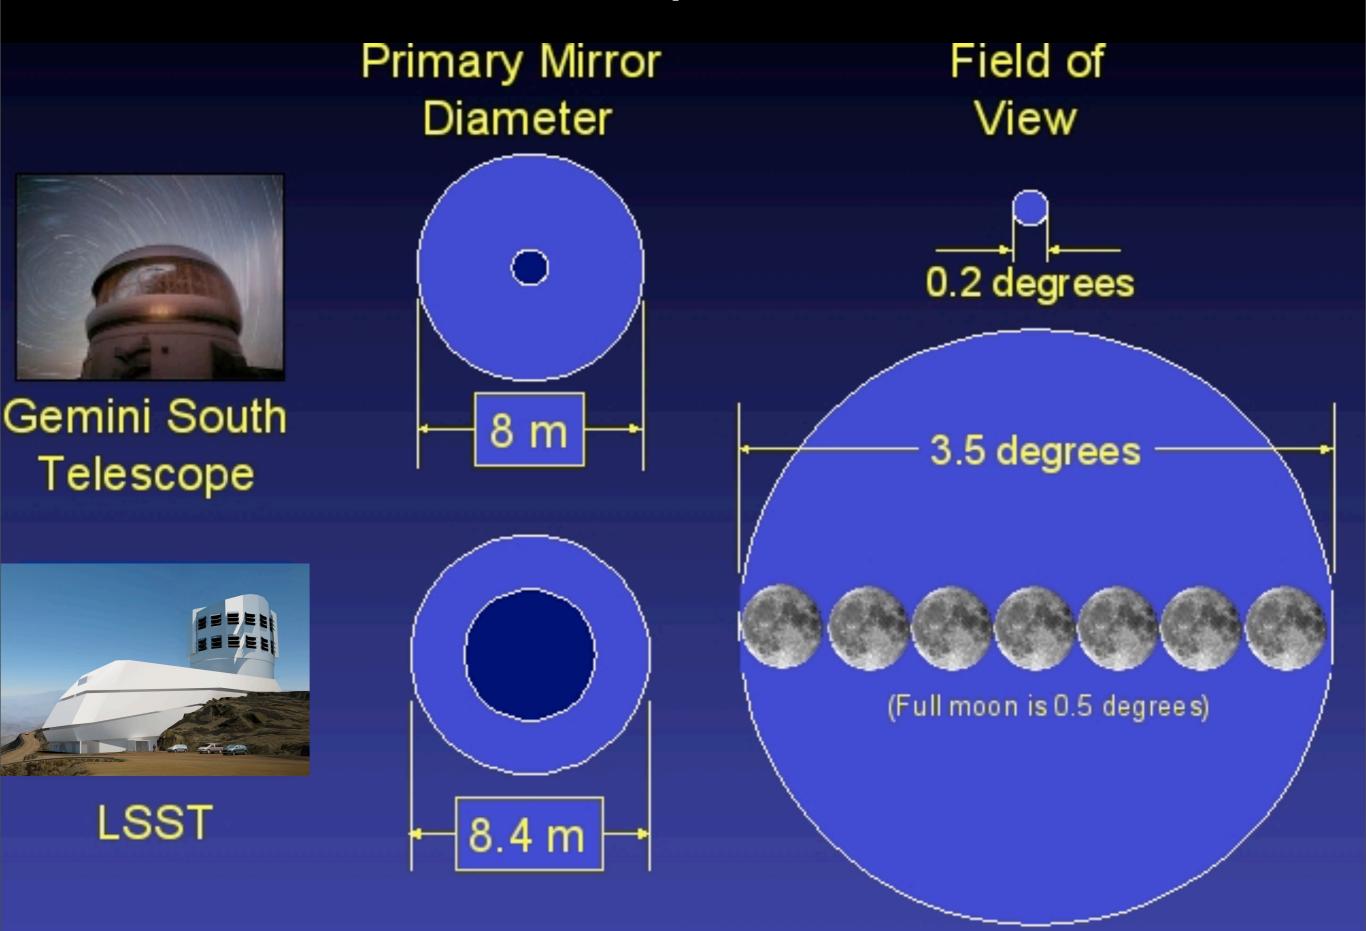

LSST system Telescope Camera Software

A COLORADO

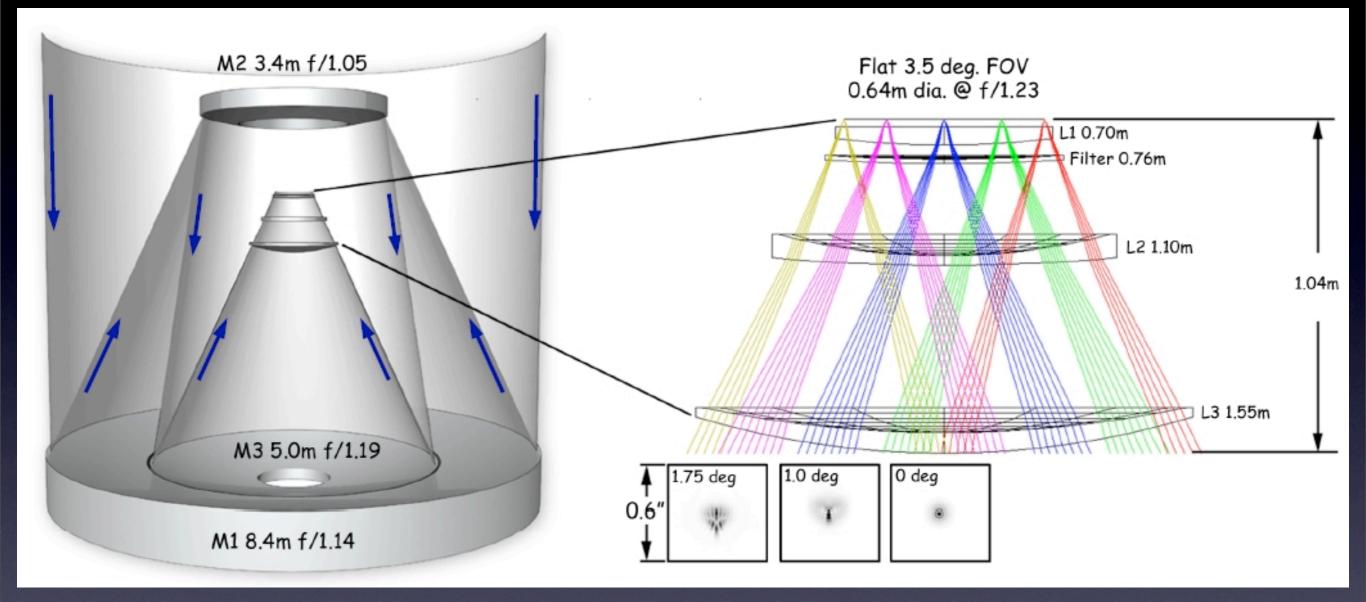

### LSST Telescope

## The field-of-view comparison: Gemini vs. LSST

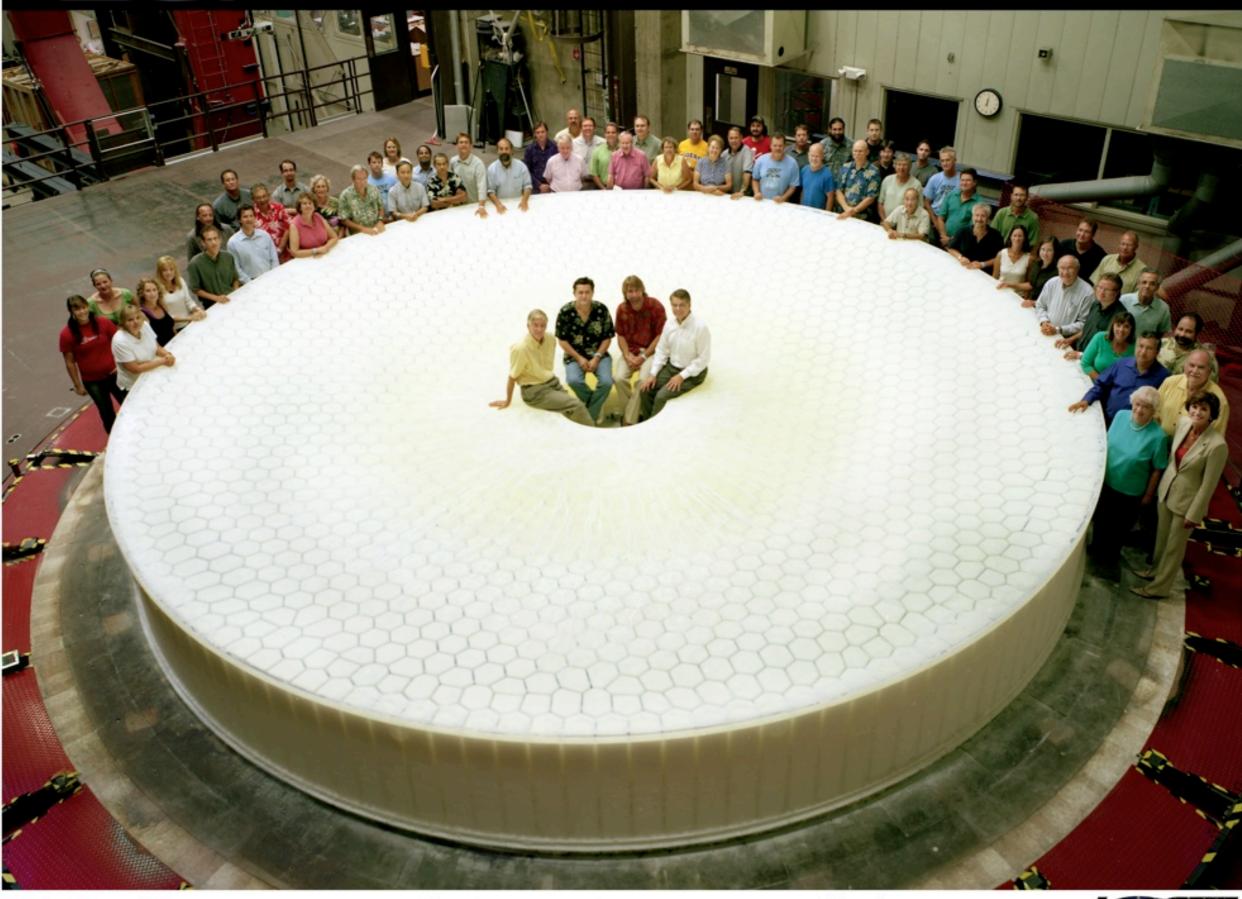

# **Optical Design for LSST**

Three-mirror design (Paul-Baker system) enables large field of view with excellent image quality: delivered image quality is dominated by atmospheric seeing

#### Large Synoptic Survey Telescope

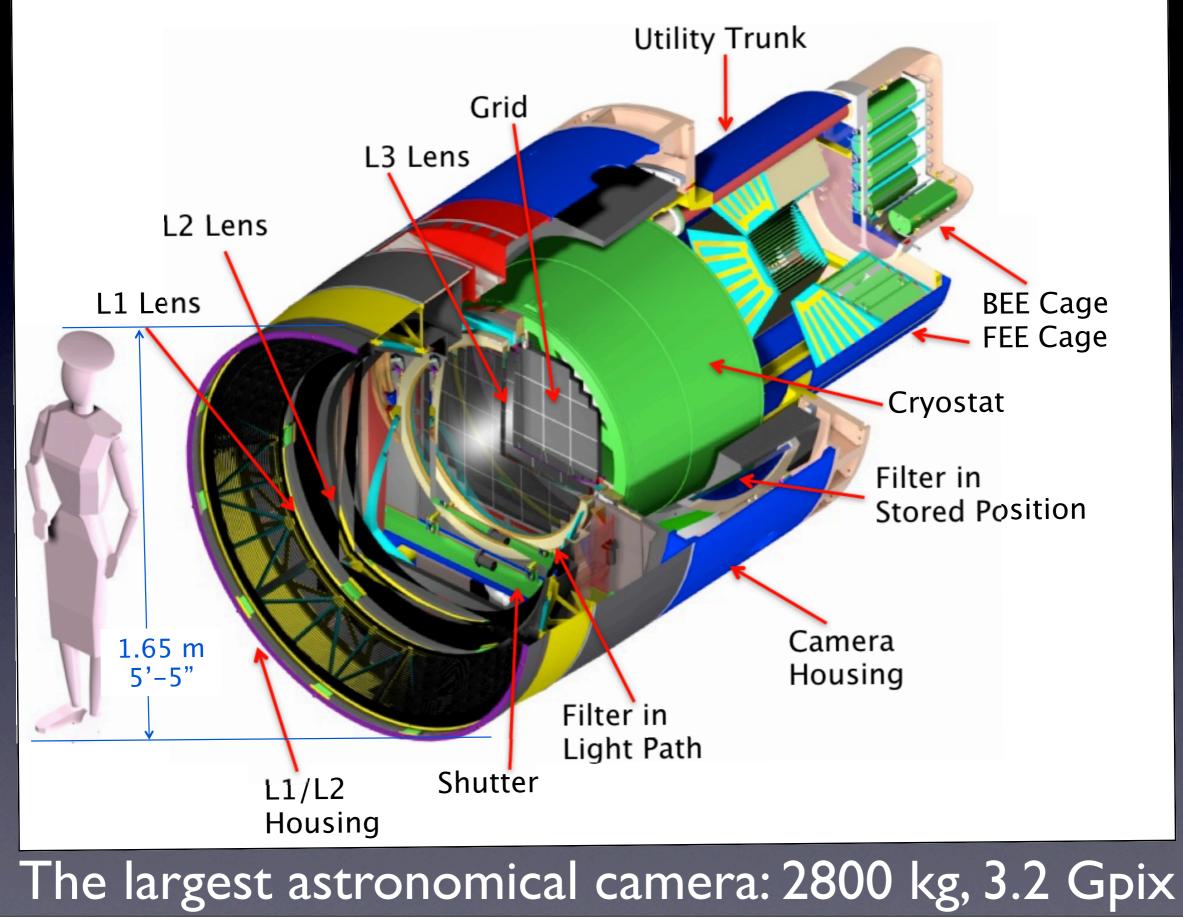

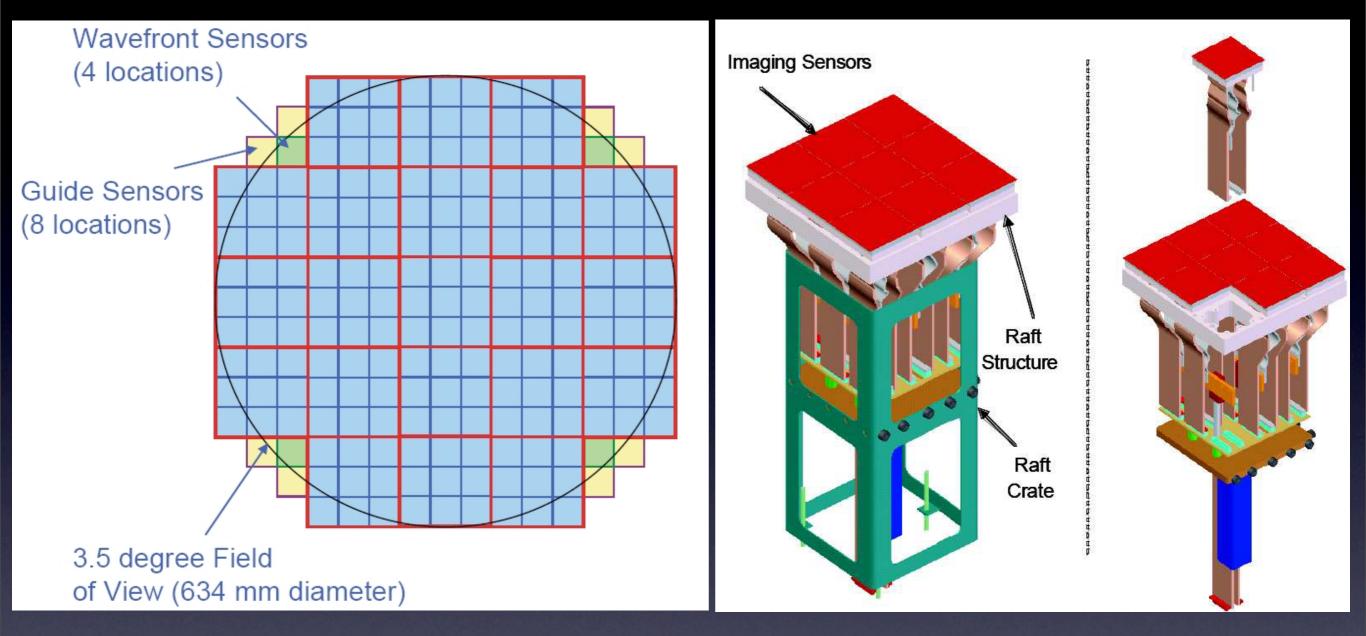

LSST Primary/Tertiary Mirror Blank August 11, 2008, Steward Observatory Mirror Lab, Tucson, Arizona

## LSST camera

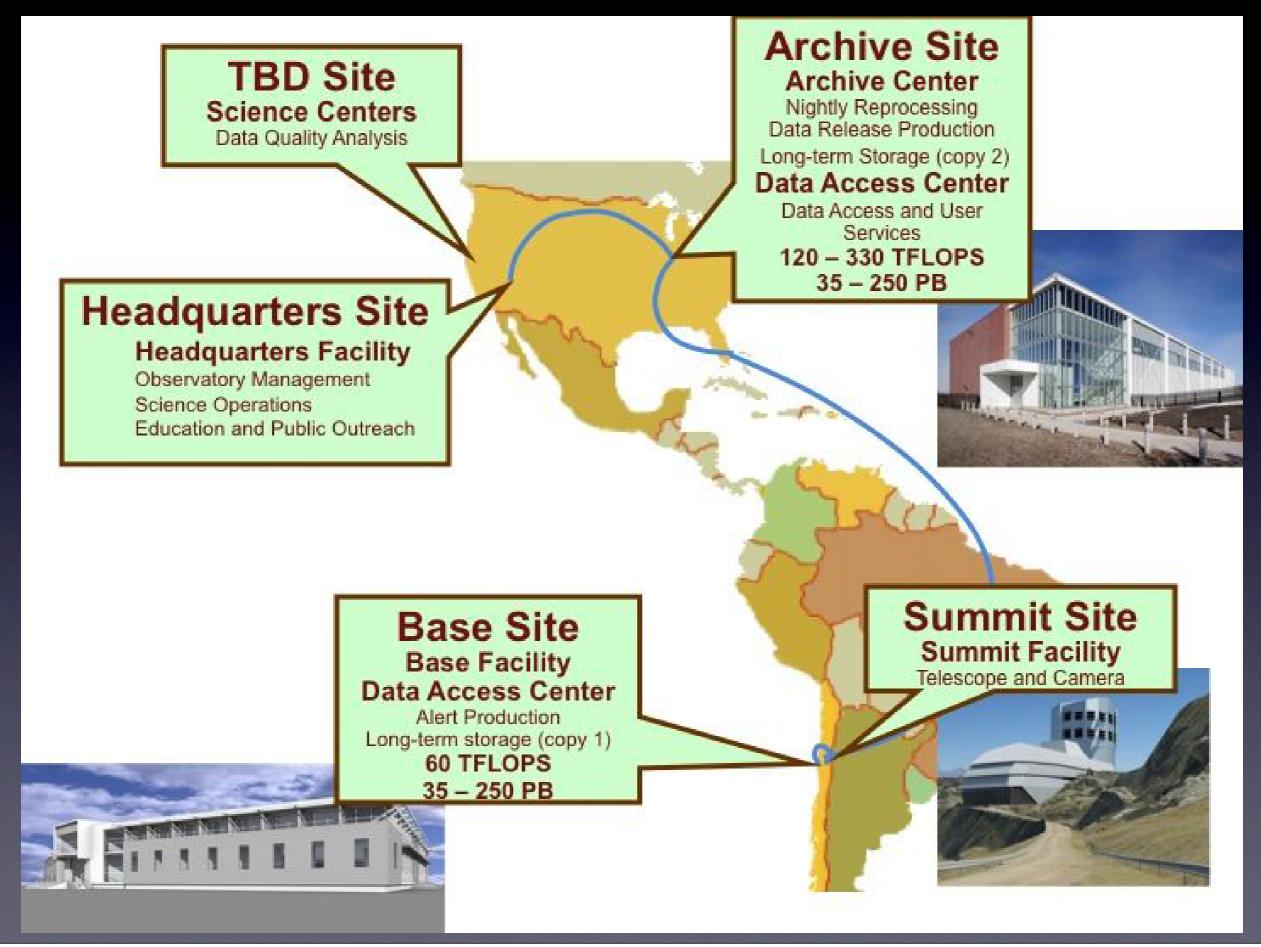

# LSST camera

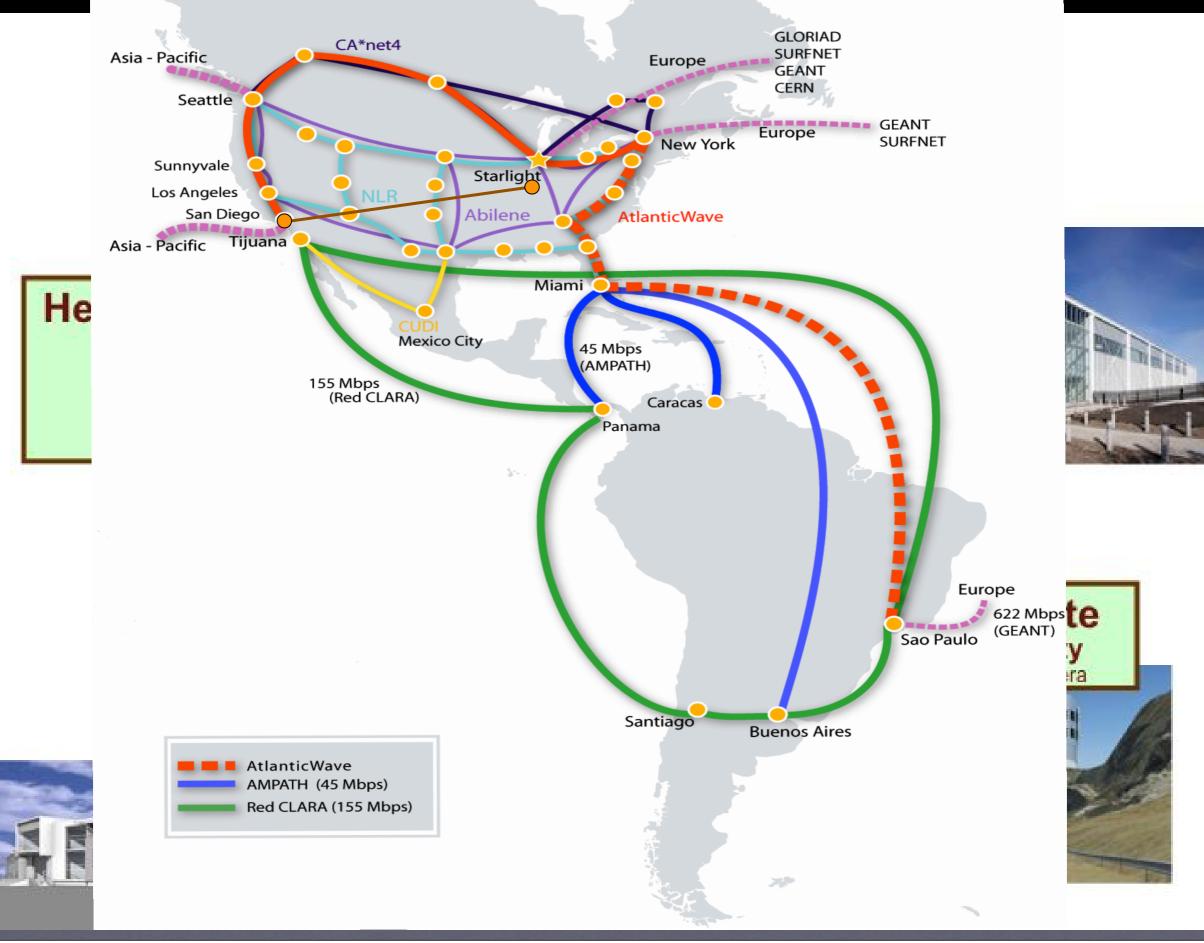

Modular design: 3200 Megapix = 189 x16 Megapix CCD 9 CCDs share electronics: raft (=camera) Problematic rafts can be replaced relatively easily

#### LSST Software

### LSST Software

#### Software: the subsystem with the highest risk

- 20 TB of data to process every day
- I000 measurements for 20 billion objects during I0 years
- Existing tools and methods (e.g. SDSS) do not scale up to LSST data volume and rate

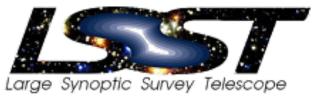

Software: the subsystem with the highest risk

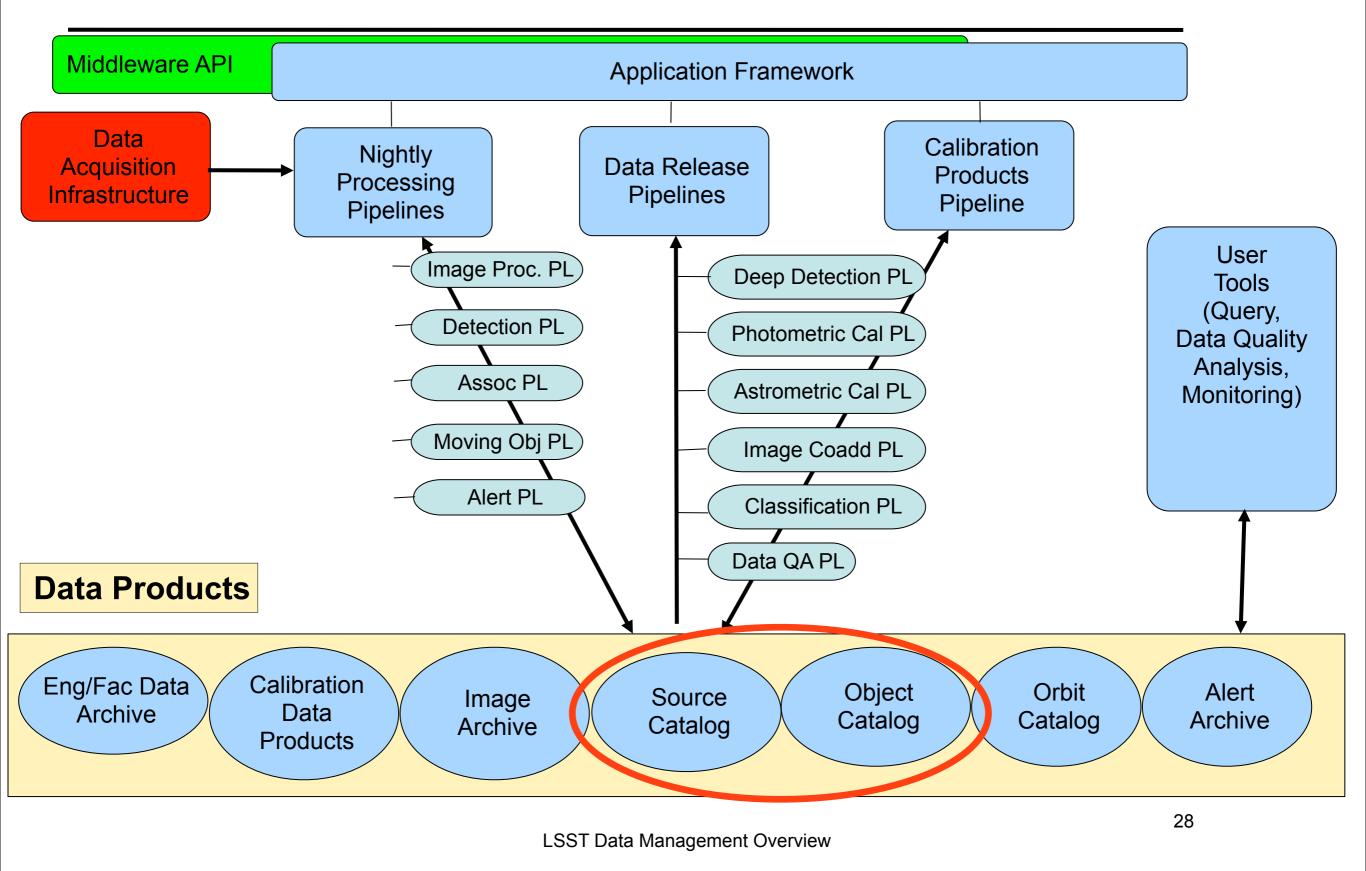

- 20 TB of data to process every day
- I000 measurements for 20 billion objects during I0 years
- Need for new tools and methods:
   software, software, software!

- About 5-10 million lines of new code
- C++/python
- A collaboration of astronomers, physicists and professional programmers

#### **Application Layer - pipelines process**

#### raw data to products

# A comparison of LSST data processing with other software projects:

- Complexities we have to deal with in DM
  - Very high data volumes (transfer, ingest, and especially query)
  - Advances in scale of algorithms for photometry, astrometry, PSF estimation, moving object detection, shape measurement of faint galaxies
  - Provenance recording and reprocessing
  - Evolution of algorithms and technology

#### Complexities we DON'T have to deal with in DM

- Tens of thousands of simultaneous users (e.g. online stores)
- Fusion of remote sensing data from many sources (e.g. earthquake prediction systems)
- Millisecond or faster time constraints (e.g. flight control systems)
- Very deeply nested multi-level transactions (e.g. banking OLTP systems)
- Severe operating environment-driven hardware limitations (e.g. spaceborne instruments)
- Processing that is highly coupled across entire data set with large amount of inter-process communication (e.g. geophysics 3D Kirchhoff migration)

#### Outline

# • LSST system summary

- o Science Themes
- o System Characteristics

# • LSST science examples

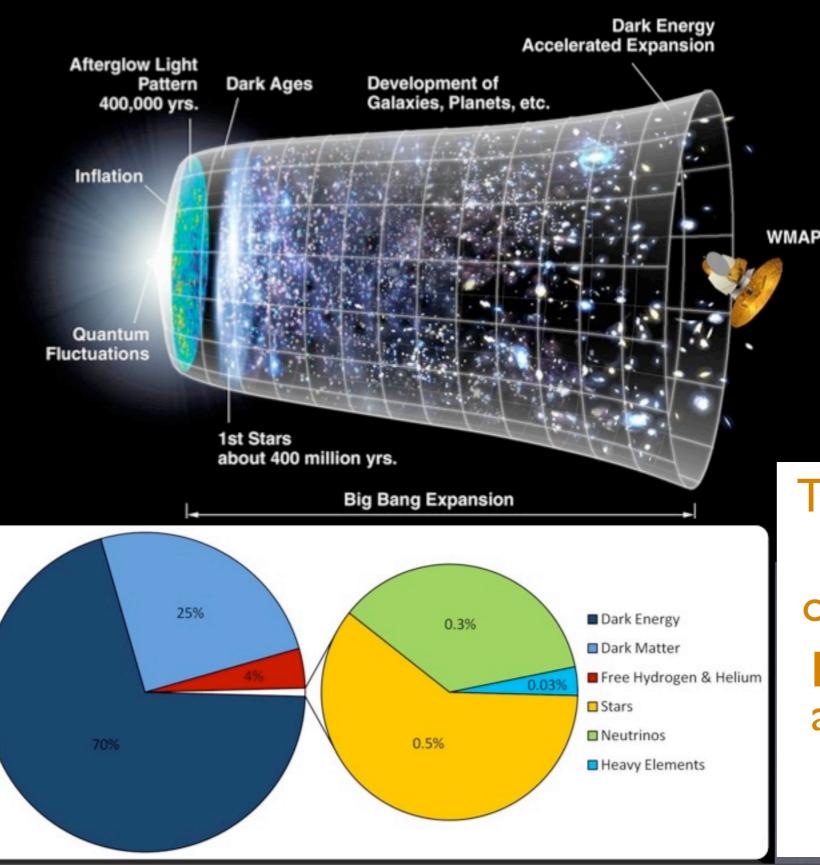

o Extragalactic astronomy and cosmology o The Milky Way and the Local Group o Time Domain

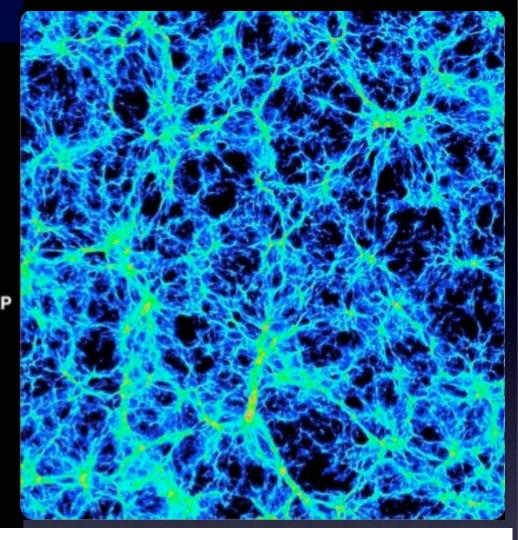

# Opportunities for collaboration

- o Construction
- o Operations
- o Science Collaborations

## New Cosmological Puzzles

#### **ACDM:** The 6-parameter Theory of the Universe

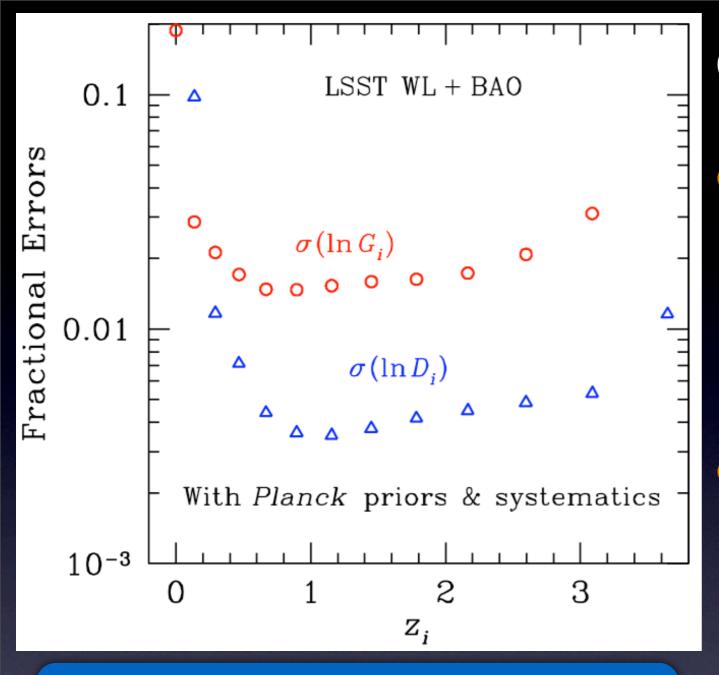

The modern cosmological models can explain all observations, but need to **postulate** dark matter and dark energy (though gravity model could be wrong, too)

## **Modern Cosmological Probes**

- Cosmic Microwave Background (the state of the Universe at the recombination epoch, at redshift ~1000)
- Weak Lensing: growth of structure
- Galaxy Clustering: growth of structure
- Baryon Acoustic Oscillations: standard ruler
- Supernovae: standard candle

Except for CMB, measuring H(z) and growth of structure g(z)

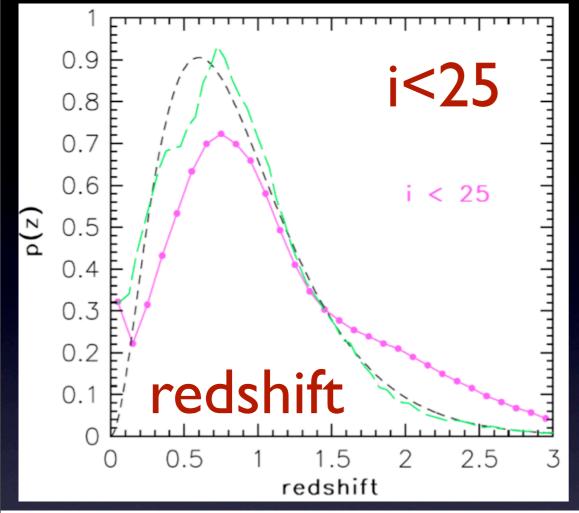

By simultaneously measuring growth of structure and curvature, LSST data will tell us whether the recent acceleration is due to dark energy or modified gravity.

# Cosmology with LSST

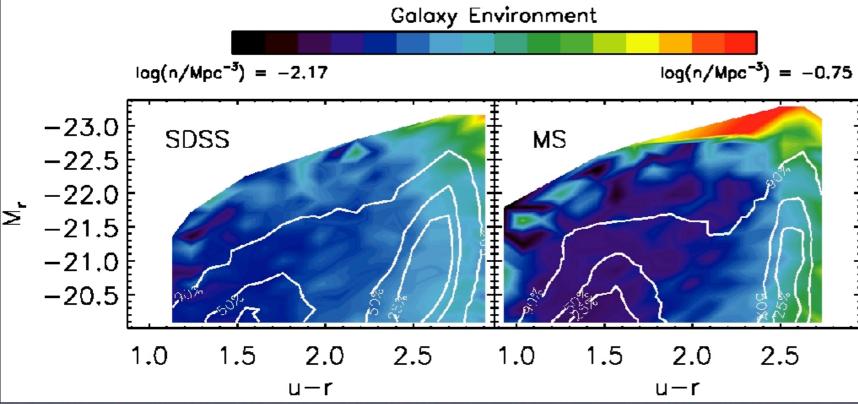

- Derived from 4 billion galaxies (i<25.3, SNR>20) with accurate photo-z and shape measurements
- Measuring distances and growth of structure with a percent accuracy for 0.5 < z < 3</li>
- SNe will provide a high angular resolution probe of homogeneity and isotropy of the Universe

#### Extragalactic astronomy: galaxies

 About 10 billion galaxies, with 4 billion in a "gold" sample defined by i<25.3</li>

The "gold" sample extends to redshifts of >2.5: evolution

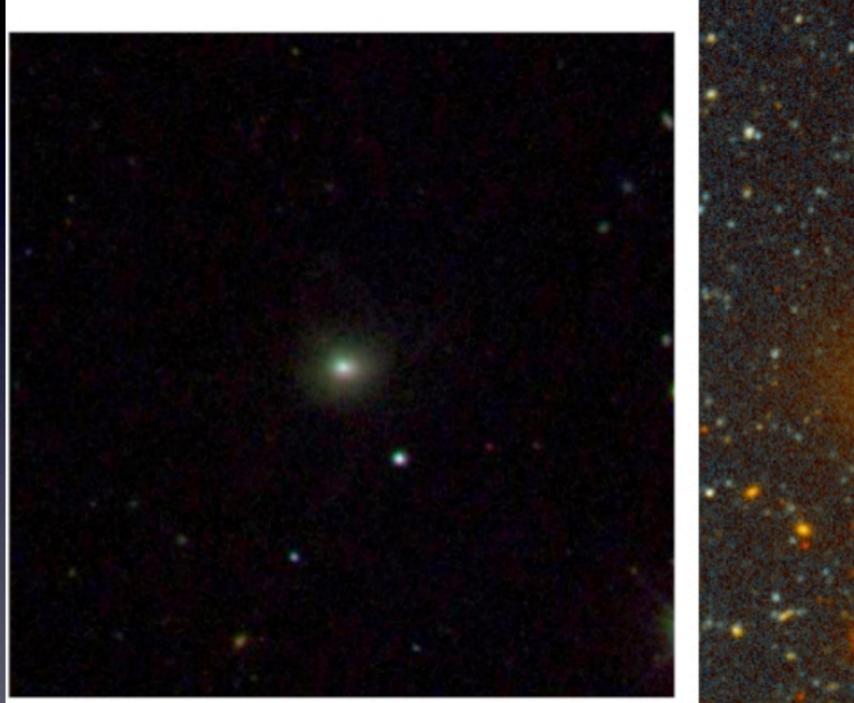

# SDSS: snapshot at z~0 LSST: a galaxy evolution movie to z~2.5

#### Extragalactic astronomy: galaxies

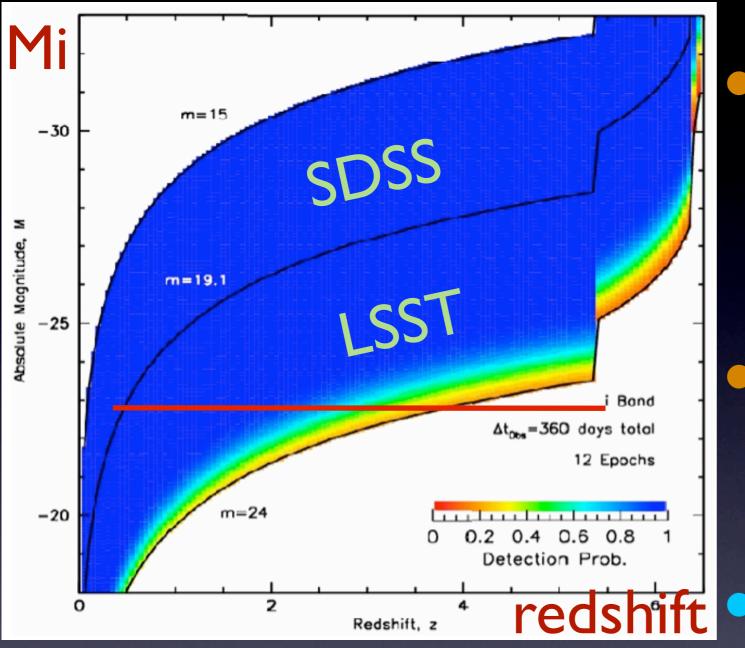

#### SDSS

#### MUSYC

#### Extragalactic astronomy: quasars

**Top:** absolute magnitude vs. redshift diagram for quasars

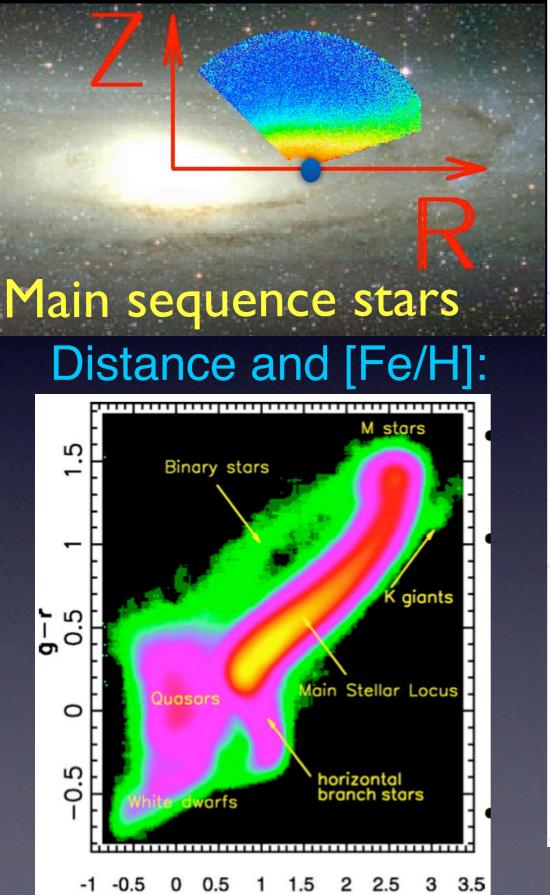

About 10 million quasars will be discovered using variability, colors, and the lack of proper motions

The sample will include Mi=-23 objects even at redshifts beyond 3

Quasar variability studies will be based on millions of light curves with 1000 observations over 10 yrs

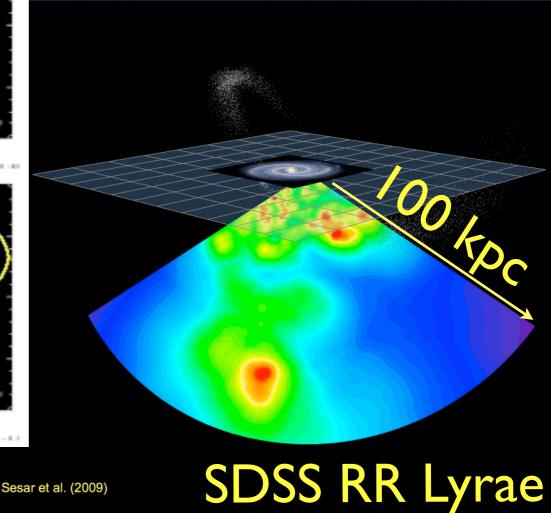

#### LSST will detect ~10,000 quasars with 6<z<7.5

#### The Milky Way structure: 10 billion stars, time domain

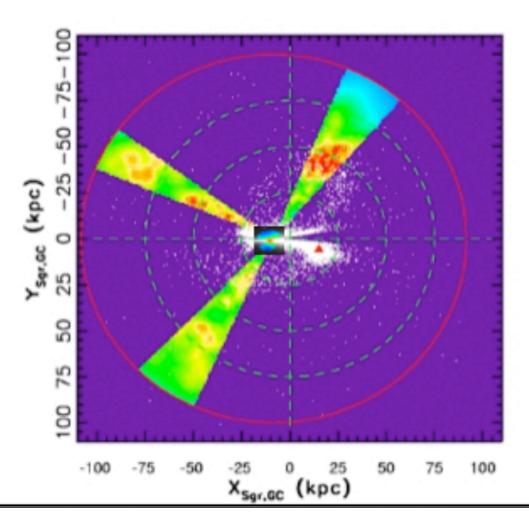

0.35 < r - i < 0.405000

Compared to SDSS: LSST can "see" 10 times further away and over twice as large an area

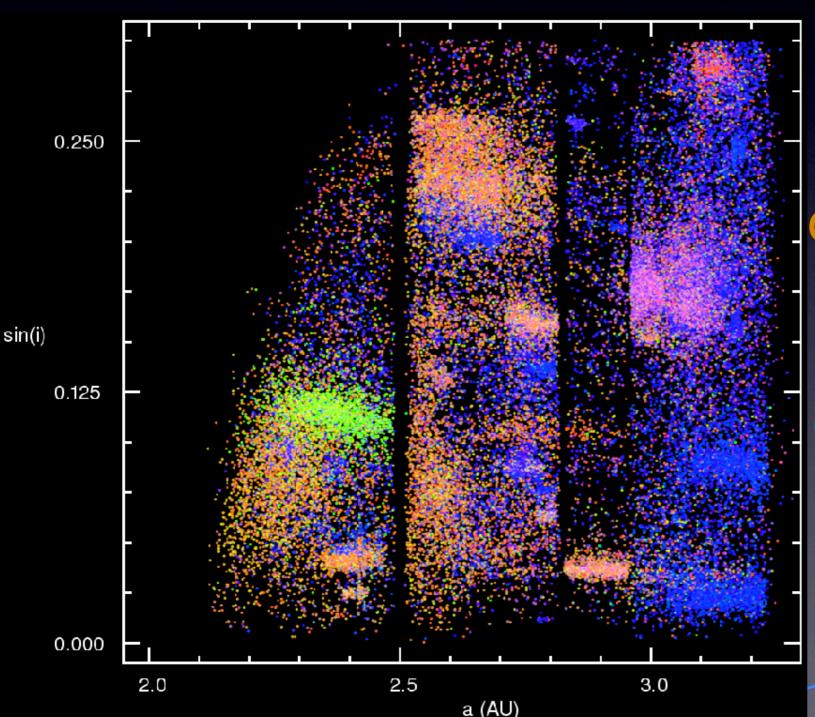

The large blue circle: the  $\sim$ 400 kpc limit of future LSST studies based on RR Lyrae

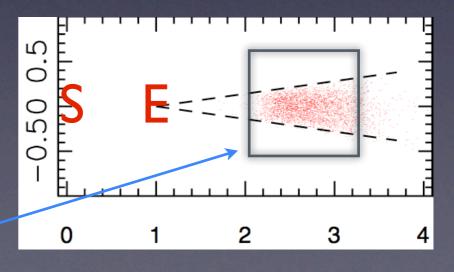

The large red circle: the ~100 kpc limit of future to the LSST studies based on main-sequence stars (and the current limit for RR Lyrae studies)

The small insert: ~10 kpc limit of SDSS and future Gaia studies for kinematic & [Fe/H] mapping with MS stars Time Domain: objects changing in time positions: asteroids and stellar proper motions brightness: cosmic explosions and variable stars Time Domain: objects changing in time positions: asteroids and stellar proper motions brightness: cosmic explosions and variable stars

For example: SDSS demonstrated that asteroid families have distinct colors: chemical composition LSST will turn this diagram into a movie (millions of asteroids)

#### Killer asteroids: the impact probability is not 0

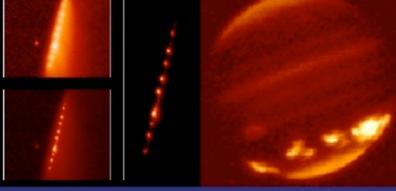

Shoemaker-Levy 9 (1994)

Tunguska (1908)

The Barringer Crater, Arizona: a 40m object 50,000 yr. ago

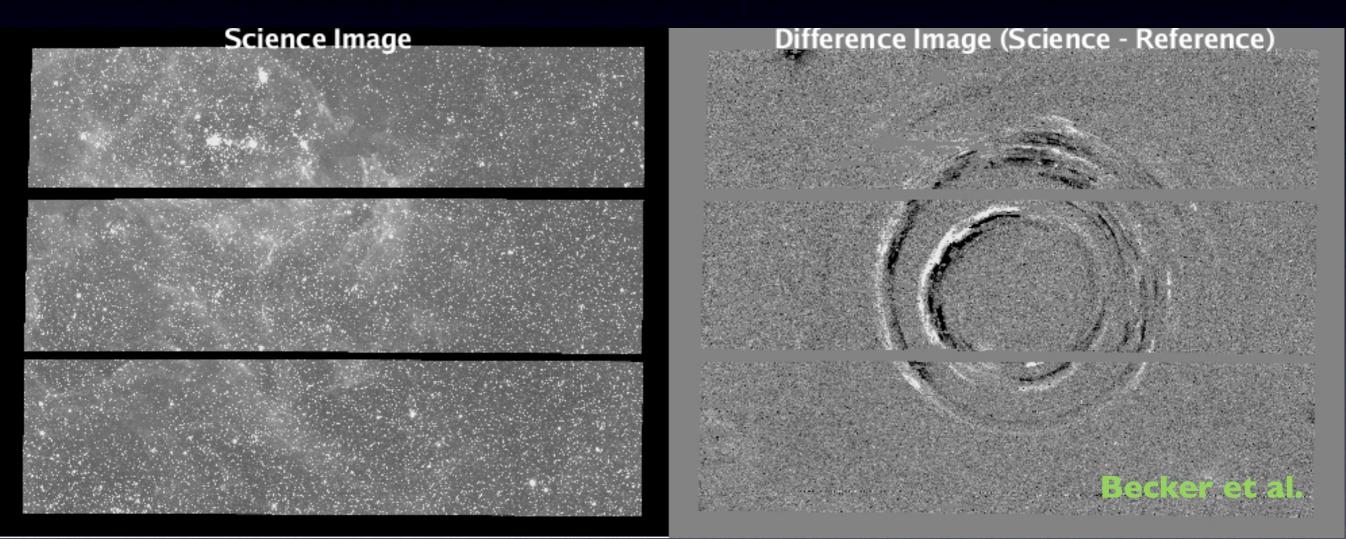

Wednesday, February 8, 2012

LSST is the only survey capable of delivering completeness specified in the 2005 Congressional NEO mandate to NASA (to find 90% NEOs larger than 140m)

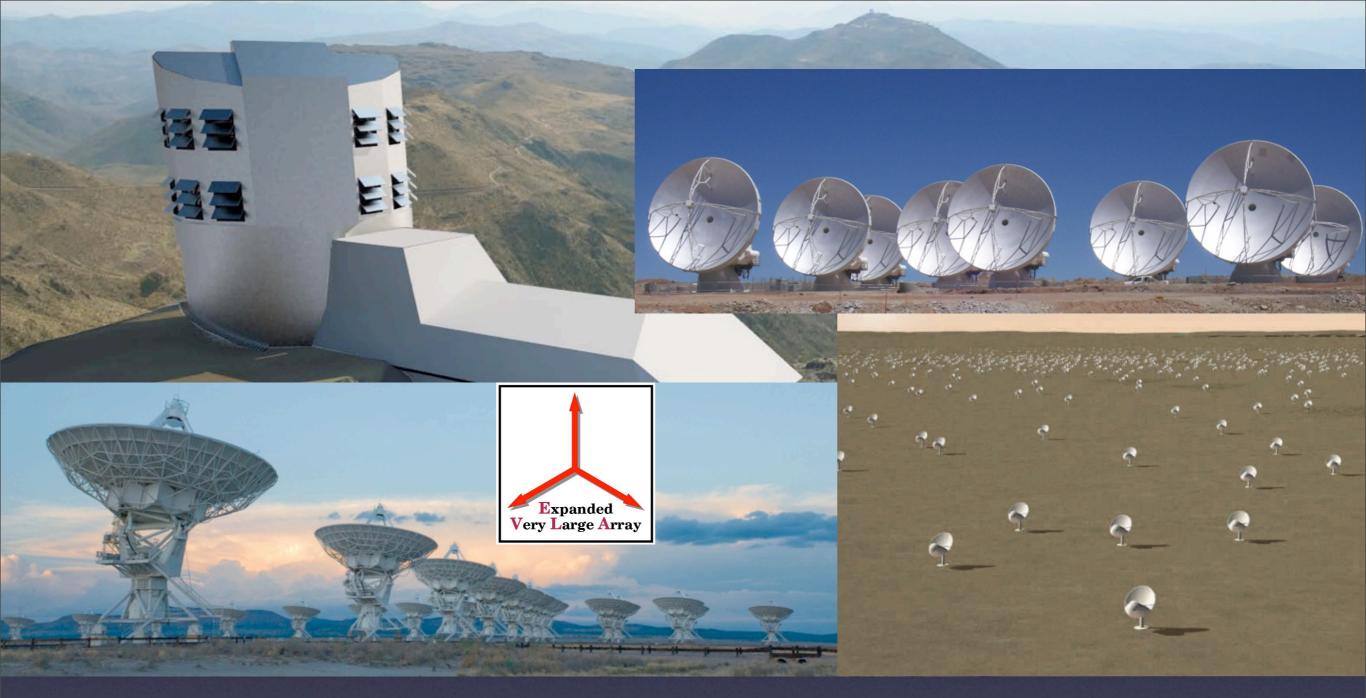

photomontage!

Time Domain: objects changing in time positions: asteroids and stellar proper motions brightness: cosmic explosions and variable stars

Not only point sources - echo of a supernova explosion:

As many variable stars from LSST, as all stars from SDSS Web stream with data for transients within 60 seconds

The impact of LSST on other wavelengths, and vice versa:
I) Science Results (e.g. galaxy/AGN evolution)
2) Tools and Methods (e.g. massive databases [radio])
3) Supplemental data (coeval, identification, physical processes) Also non-EM: e.g. Advanced LIGO

#### Outline

## • LSST system summary

- o Science Themes
- o System Characteristics

# • LSST science examples

o Extragalactic astronomy and cosmology o The Milky Way and the Local Group o Time Domain

# Opportunities for collaboration

- o Construction
- o Operations
- o Science Collaborations

#### **Decadal Survey 2010**

## Priorities:

#### • Spaced-based:

Wide-Field Infrared Survey Telescope WFIRST
 The Explorer Program "rapid response"
 Laser Interferometer Space Antenna LISA
 International X-ray Observatory IXO

# Ground-based: *Large Synoptic Survey Telescope LSST*2) Mid-scale Innovations Program "rapid response" 3) Giant Segmented Mirror Telescope (30m) GSMT 4) Atmospheric Čerenkov Telescope Array (Y) ACTA 5) Cerro Chajnantor Atacama Telescope (submm) CCAT

# • Why LSST?

The top rank accorded to LSST is a result of:
(1) "its <u>compelling science case</u> and capacity to address so many of the science goals of this survey", [and]
(2) "<u>its readiness</u> for submission to the MREFC process as informed by its technical maturity, the survey's assessment of risk, and appraised construction and operations costs."
Also: "education and public outreach"

**Decadal Survey 2010** 

Bill Gates: "LSST will be the ultimate network peripheral device to the Universe"

Google Sky, World Wide Telescope, ...

# • Why LSST?

#### Decadal Survey 2010

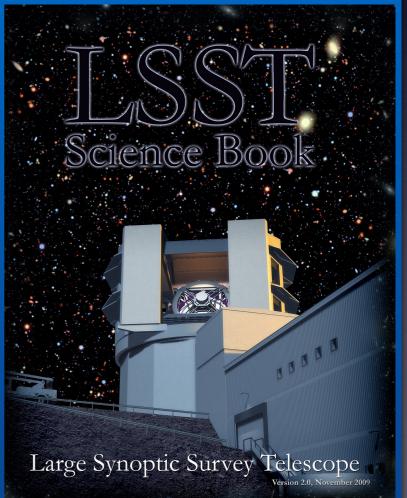

The top rank accorded to LSST is a result of: (1) "its compelling science case and capacity to address so many of the science goals of this survey", [and] (2) "its readiness for submission to the MREFC process as informed by its technical maturity, the survey's assessment of risk, and appraised construction and operations costs."

Also: "education and public outreach"

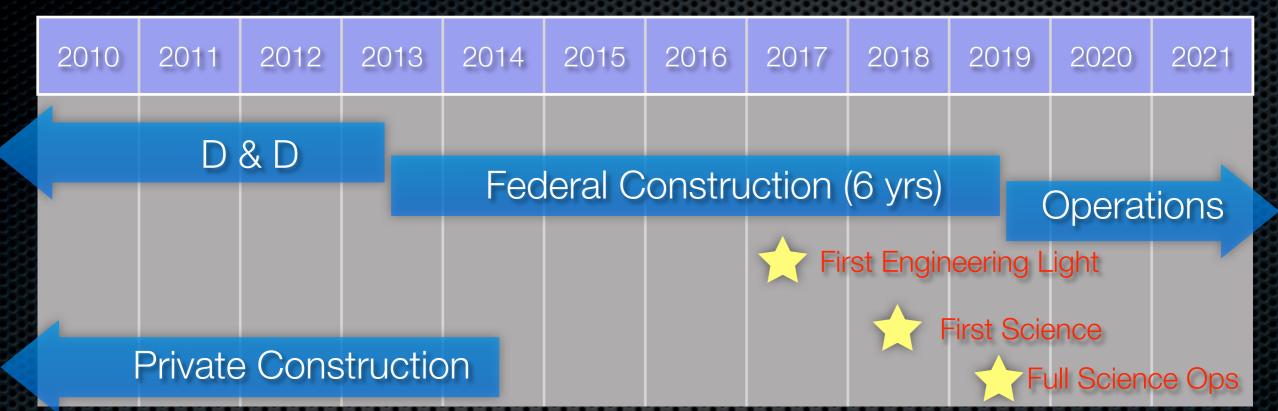

#### **LSST Science Book**

Summarizes the basic parameters of the LSST hardware, software, and observing plans, discusses educational and outreach opportunities, and describes a broad range of science that LSST will revolutionize

245 authors, 15 chapters, 600 pages

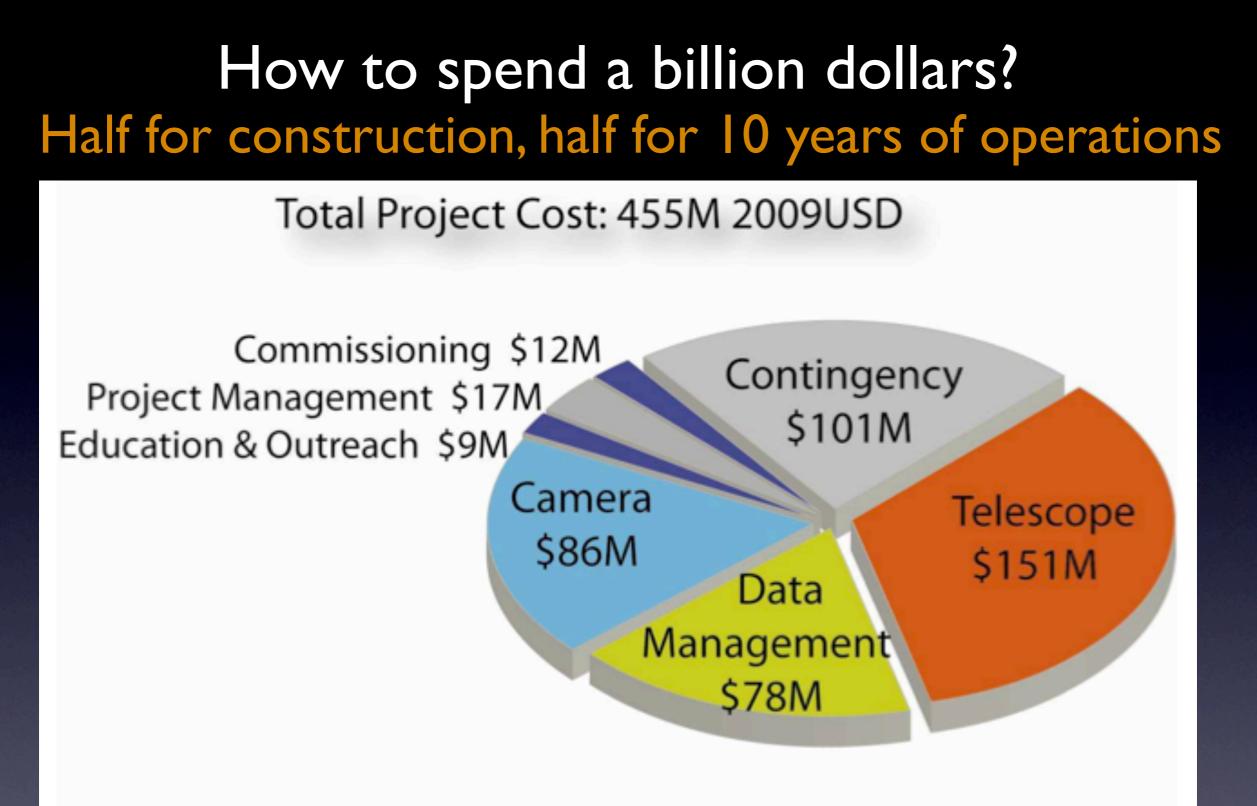

# LSST Timeline

#### Estimate: survey operations begin in 2019 (if MREFC in FY2014)

- Primary/Tertiary Mirror being polished, have secondary mirror blank
- Sensor development program delivered first prototype sensors
- Processing pipelines under construction, hand-in-hand with simulations of Operations, Images, Catalogs
- **Cost:** ~\$850M in \$2011

contributions from NSF, DOE and private gifts

#### LSST Construction Component Cost

#### First light: around 2018 (if federal constr. in FY2014)

#### El Penon: Mar 8, 2011

At 8:56:00 the first blast was detonated on the El Penon summit in preparation for the LSST...

LSST-webcam 2 2011-03-08 12:56:02

# April 12, 2011

# Opportunities for collaboration

There is far more science to do than scientists to do it! Making the data available to the world (including the public) in a scientifically useful form is the best way to promote LSST science.

#### o Construction:

telescope, camera, data management: need per case arrangements (goal: cost reduction and WBS control)
Operations: per DS2010, international participants should contribute with ~ \$10M/yr (cumulative: 10% of the total survey cost); Estimated about 400-500 Pls
Science Collaborations:

access to all LSST know-how: coordination with other groups, taking advantage of synergy and complementarity, an opportunity for small teams to participate in cuttingedge research

# Science Collaborations

- o Science Collaborations are the main source of know-how and will undertake all the steps between delivering LSST data products and producing publishable science results
- o Weak lensing (Bhuvnesh Jain and Dave Wittman)
- o Strong lensing (Phil Marshall)
- o Supernovae (Michael Wood-Vasey and Richard Kessler)
- o Large-scale structure/BAO (Hu Zhan and Eric Gawiser)
- o AGN (Niel Brandt)
- o Galaxies (Harry Ferguson)
- o Galactic structure (Beth Willman and Marla Geha)
- o Stellar populations (Abi Saha and Kevin Covey)
- o Variability & transients (Lucianne Walkowicz & Josh Bloom)
- o Solar system (Lynne Jones and Michael Brown)
- o Informatics and Statistics (Kirk Borne)

# Science Collaborations

o Currently over 400 people are involved in one of the science collaborations.

o Membership is drawn from those working on LSST infrastructure and from LSST member institutions.

o Membership is more than "adding your name to the mailing list"; members are expected to contribute actively to the collaboration.

o Accomplishments: LSST Science Book, simulations, advocacy (meetings, papers), tools for data analysis, input to Data Management design and development

#### Impact on Data Management

o LSST software effort is underway: development of data processing algorithms, database structures, etc.

o Input from scientists is needed at all stages: algorithm design/development, testing, definition of quantities to be measured, database design, etc.

o Science collaborations will have opportunity to run their own codes on LSST data using LSST infrastructure.

o Science collaborations will have an impact on commissioning and survey data taking

# Impact on Commissioning

o We will have two years from engineering first light to confirm that we meet our science requirements.

o Scientists will be involved in all stages of this commissioning period: planning the observations that will be carried out, analyzing the first data, and publishing results

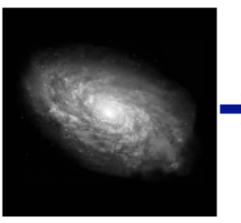

o Carrying out scientific analyses with early data will be the best way to reveal possible subtle problems.

o Ultimately, carrying out scientific analyses with the full LSST dataset will not be trivial

# • Measuring galaxy shear: a subtle effect

#### The Forward Process.

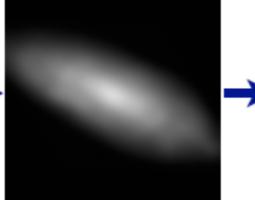

Galaxies: Intrinsic galaxy shapes to measured image:

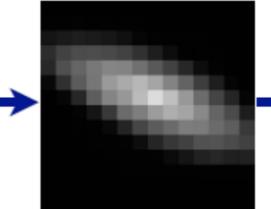

Intrinsic galaxy (shape unknown)

Gravitational lensing causes a shear (g)

Atmosphere and telescope cause a convolution

Detectors measure a pixelated image

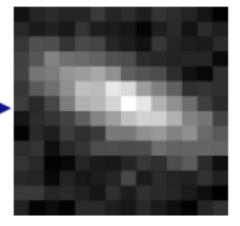

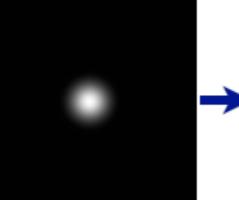

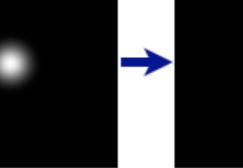

Image also contains noise

#### **Stars:** Point sources to star images:

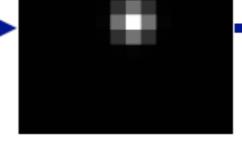

Intrinsic star (point source)

Atmosphere and telescope cause a convolution

Detectors measure

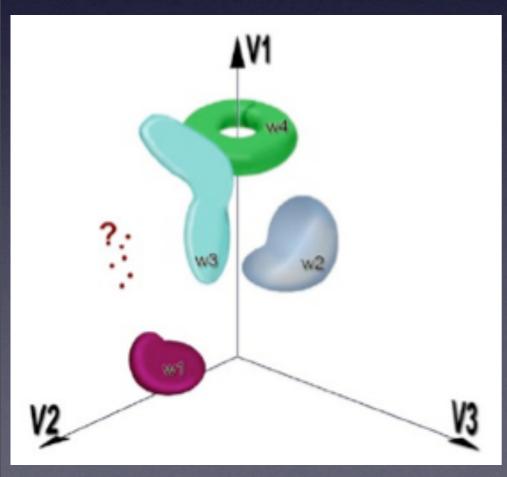

a pixelated image

Figure from S. Bridle

Image also contains noise

#### How should we measure shear, and how can we minimize and quantify systematic errors?

 Statistical analysis of a massive LSST dataset
 A large (100 PB) database and sophisticated analysis tools: for each of 20 billion objects there will be about 1000 measurements (each with a few dozen measured parameters)
 Data mining and knowledge discovery

10,000-D space with 20 billion points
Characterization of known objects
Classification of new populations
Discoveries of unusual objects
Clustering, classification, outliers

## • Where to go from here?

o The LSST Board of Directors will define how international partners (who sent LoIs: 63 institutions from 24 countries) can join LSST (hopefully later this year)

o The first steps will be signing MOUs and joining Science Collaborations (before then one can work on

formulating research problems of interest, identifying funding sources, absorbing publicly avaialable information, planning training programs, etc.)

o Although 2018 might seem far into the future, it takes time to climb up the learning curve, to develop ideas into real analysis tools, and most importantly, to develop the next generation of scientists!

#### LSST imaging processing: an example

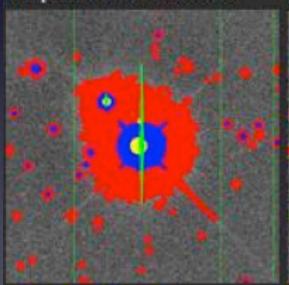

A raw data frame. The difference in bias levels from the two amplifiers is visible.

**Bias-corrected frame** with saturated pixels, bad columns, and cosmic rays masked in green.

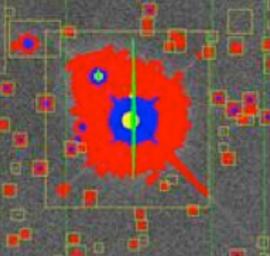

Frame corrected for saturated pixels, bad columns, and cosmic rays.

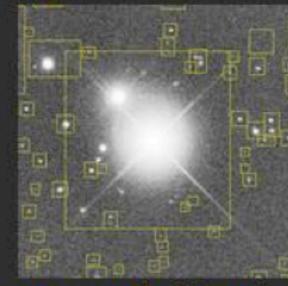

**Bright object** detections marked in blue.

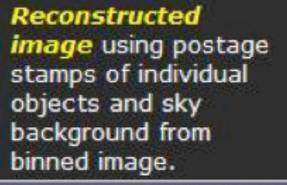

Faint object red.

Measured objects, detections marked in masked and enclosed in boxes. Small empty boxes are objects detected only in some other band.

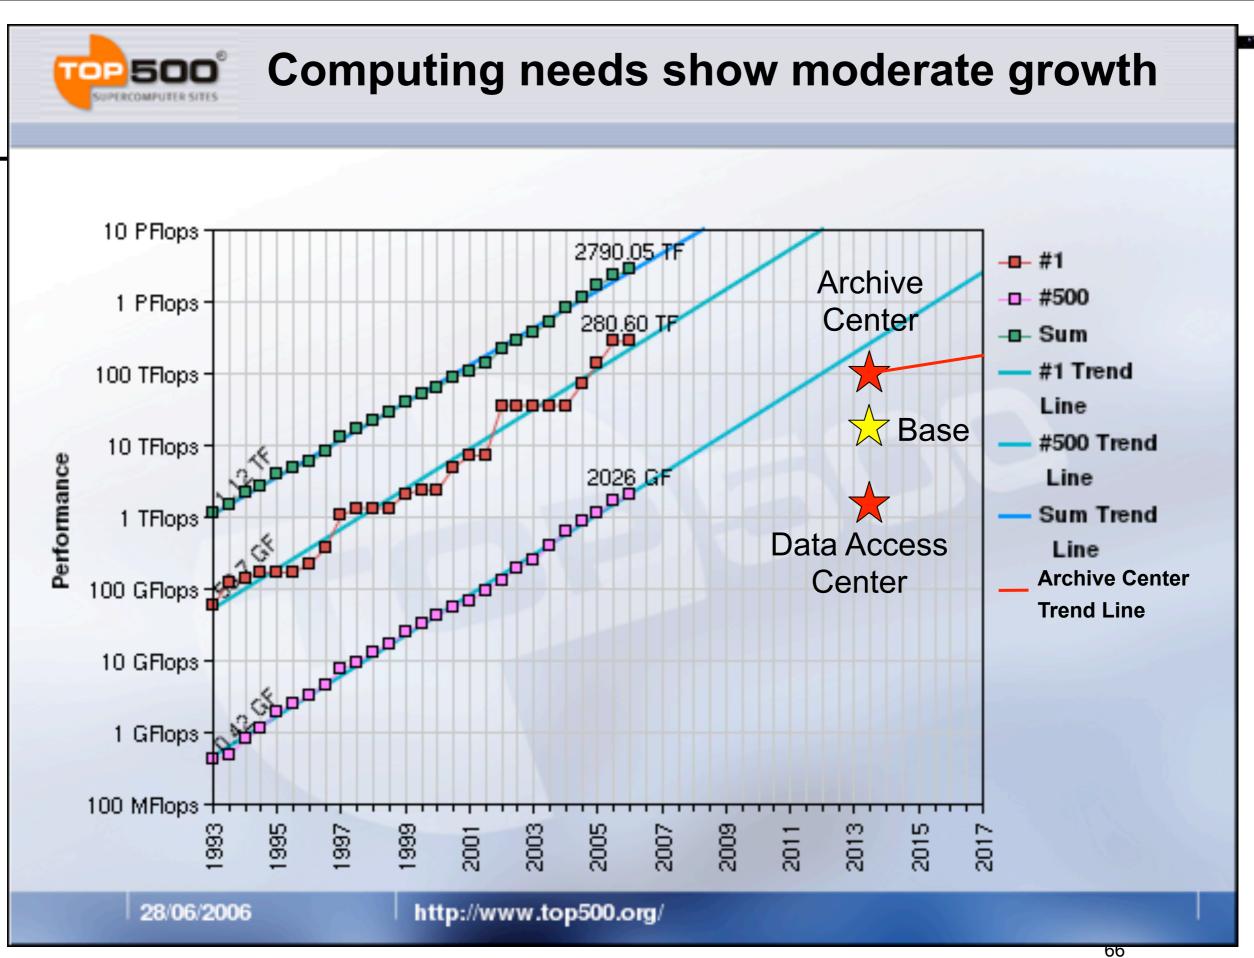

Measured objects in Reconstructed the data frame.

#### Why is LSST attractive to prospective students?

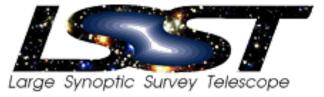

- Work with a unique astronomical dataset
   developing familiarity with faint night sky
  - meeting digital technology
  - introduction to astrophysics (colors, ...)
- Technical knowledge is not astro-specific
   work with large databases
  - data visualization (graphs, etc.)
  - statistics

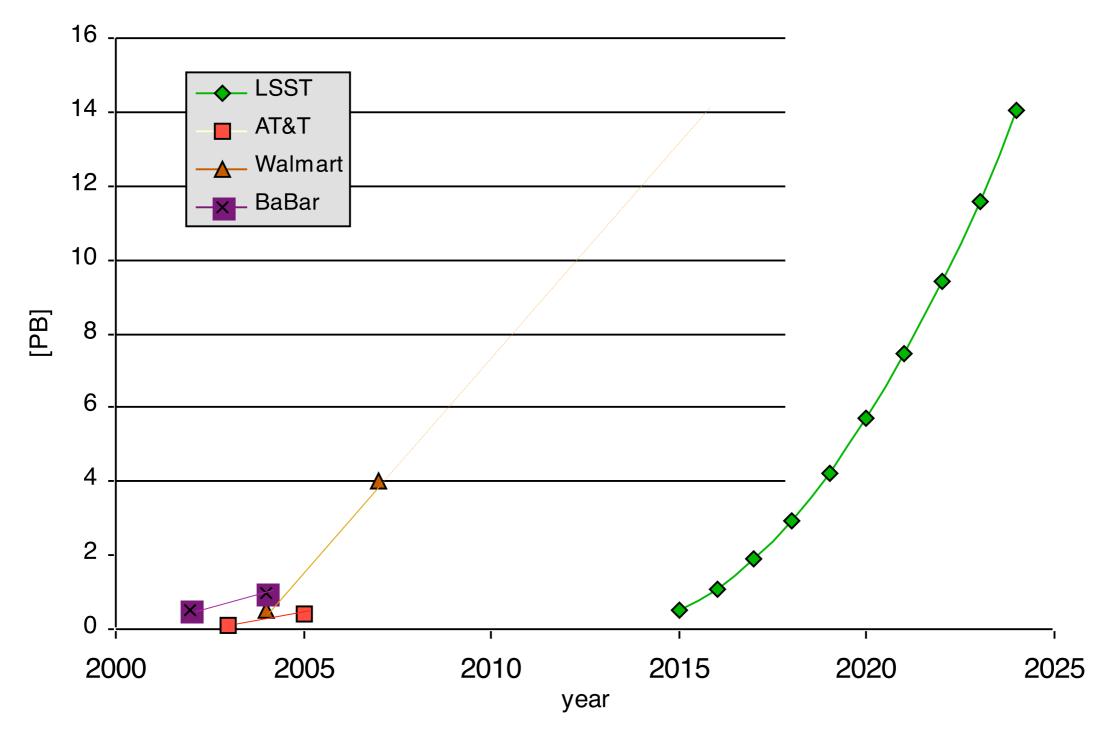

#### Astronomy offers one of the most efficient methods for attracting students to STEM professions!

LSST Data Management Overview

#### Large RDBMS Systems - Data Volumes

\* All numbers based on publicly available data

LSST Data Management Overview

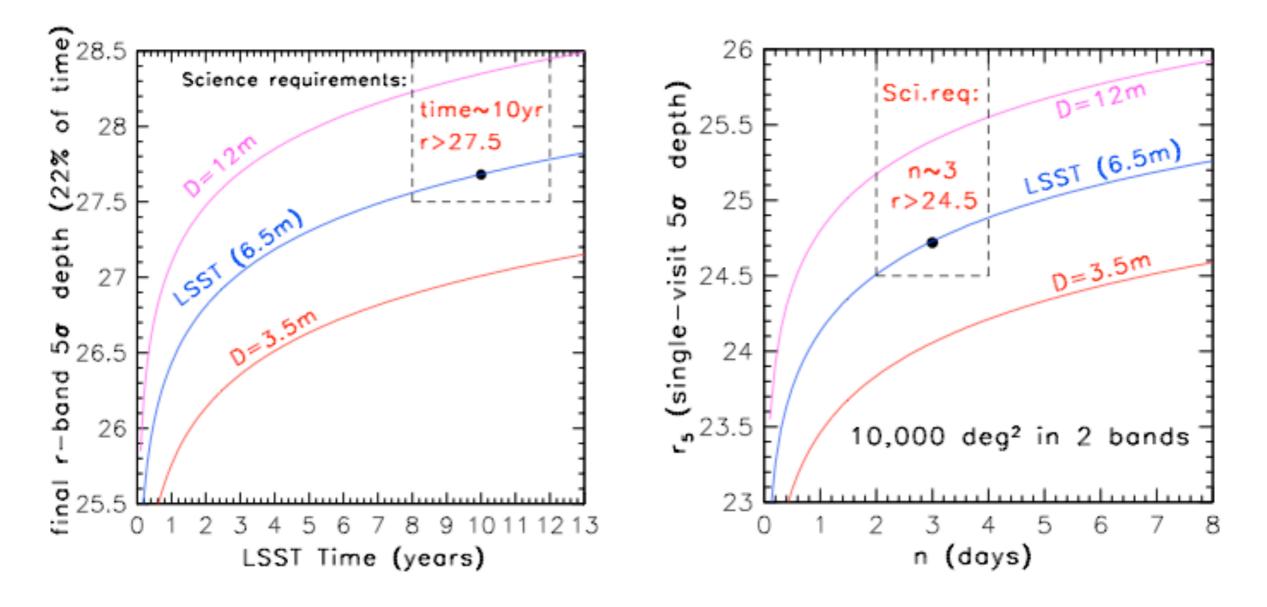

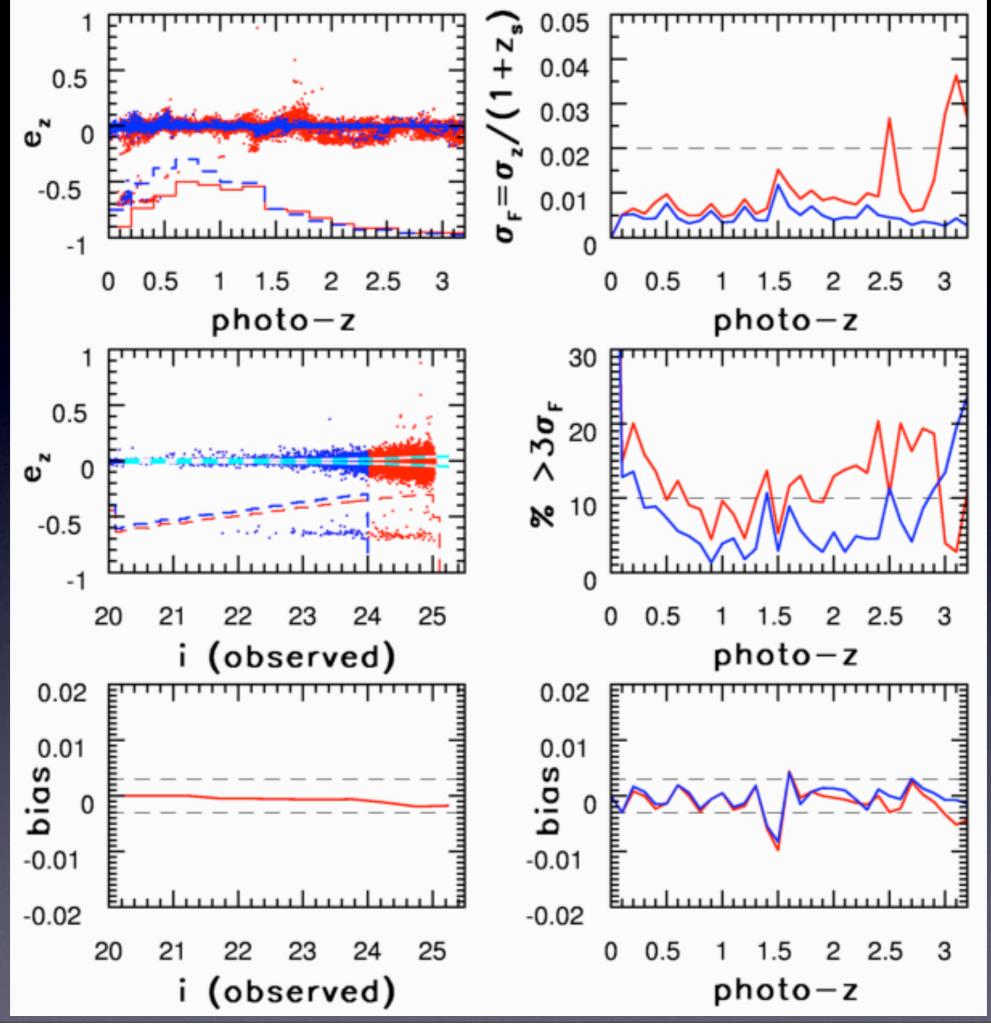

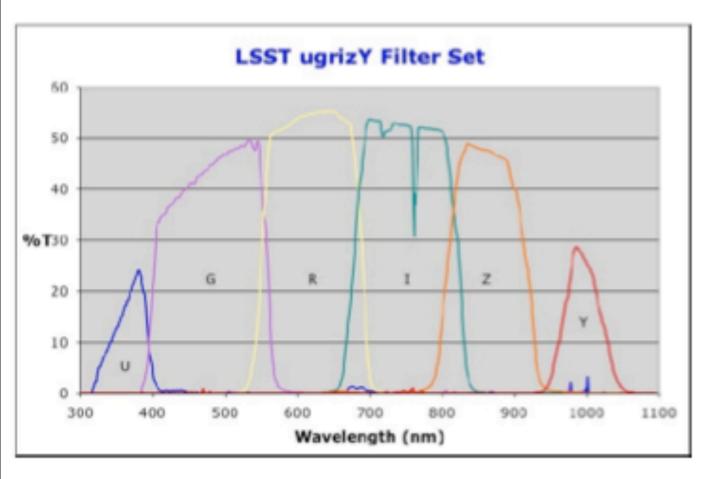

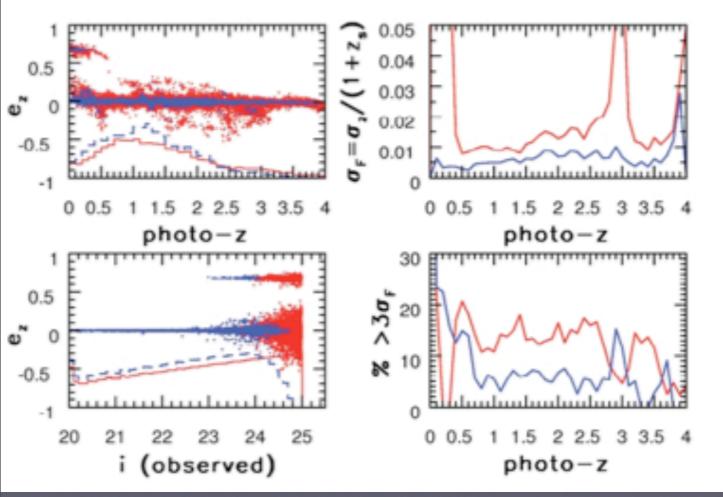

Figure 1.1: (a) The coadded depth in the r band (AB magnitudes) vs. the effective aperture and the survey lifetime. It is assumed that 22% of the total observing time (corrected for weather and other losses) is allocated for the r band, and that the ratio of the surveyed sky area to the field-of-view area is 2,000. (b) The single-visit depth in the r band ( $5\sigma$  detection for point sources, AB magnitudes) vs. revisit time, n (days), as a function of the effective aperture size. With a coverage of 10,000 deg<sup>2</sup> in two bands, the revisit time directly constrains the visit exposure time,  $t_{vis} = 10n$  seconds; these numbers can be directly scaled to the 20,000 deg<sup>2</sup> and six filters of LSST. In addition to direct constraints on optimal exposure time,  $t_{vis}$  is also driven by requirements on the revisit time, n, the total number of visits per sky position over the survey lifetime,  $N_{visit}$ , and the survey efficiency,  $\epsilon$  (see Equation 1.3). Note that these constraints result in a fairly narrow range of allowed  $t_{vis}$  for the main deep-wide-fast survey. From Ivezić et al. (2008).

Wednesday, February 8, 2012

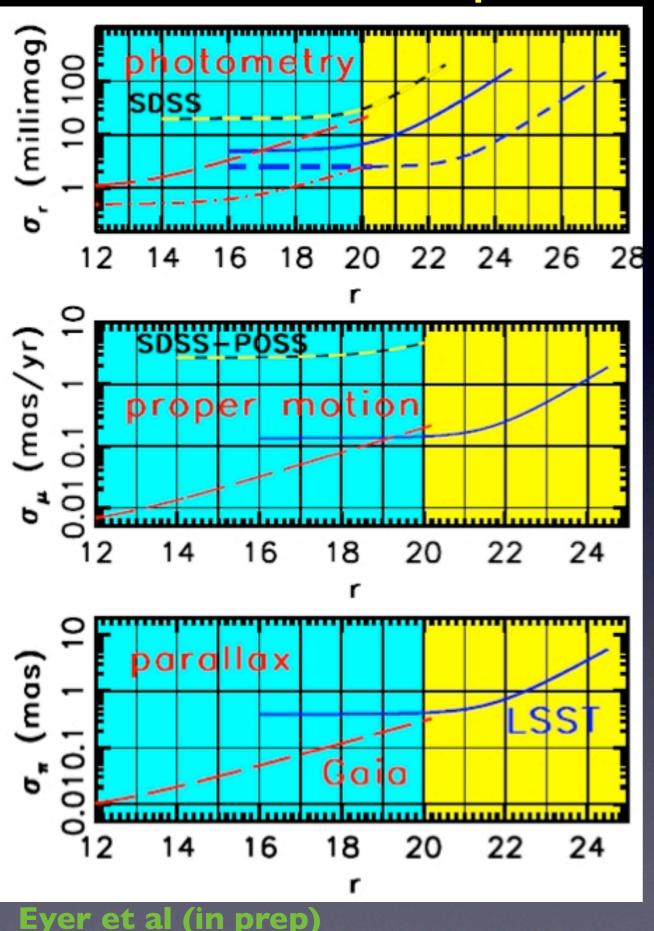

#### Control of systematics

- Image quality: large aperture to get a sufficiently large PSF correlation angle that enables the use of stars to correct shear systematics; large number of exposures (several hundred) to enable multiple chops
- Photometric redshifts: exquisite photometric accuracy (0.01 mag) and 6 photometric bands
- Cross-checks using different cosmological probes!
- Expect 3-4 times more accurate photo-z than assumed in the DETF Report

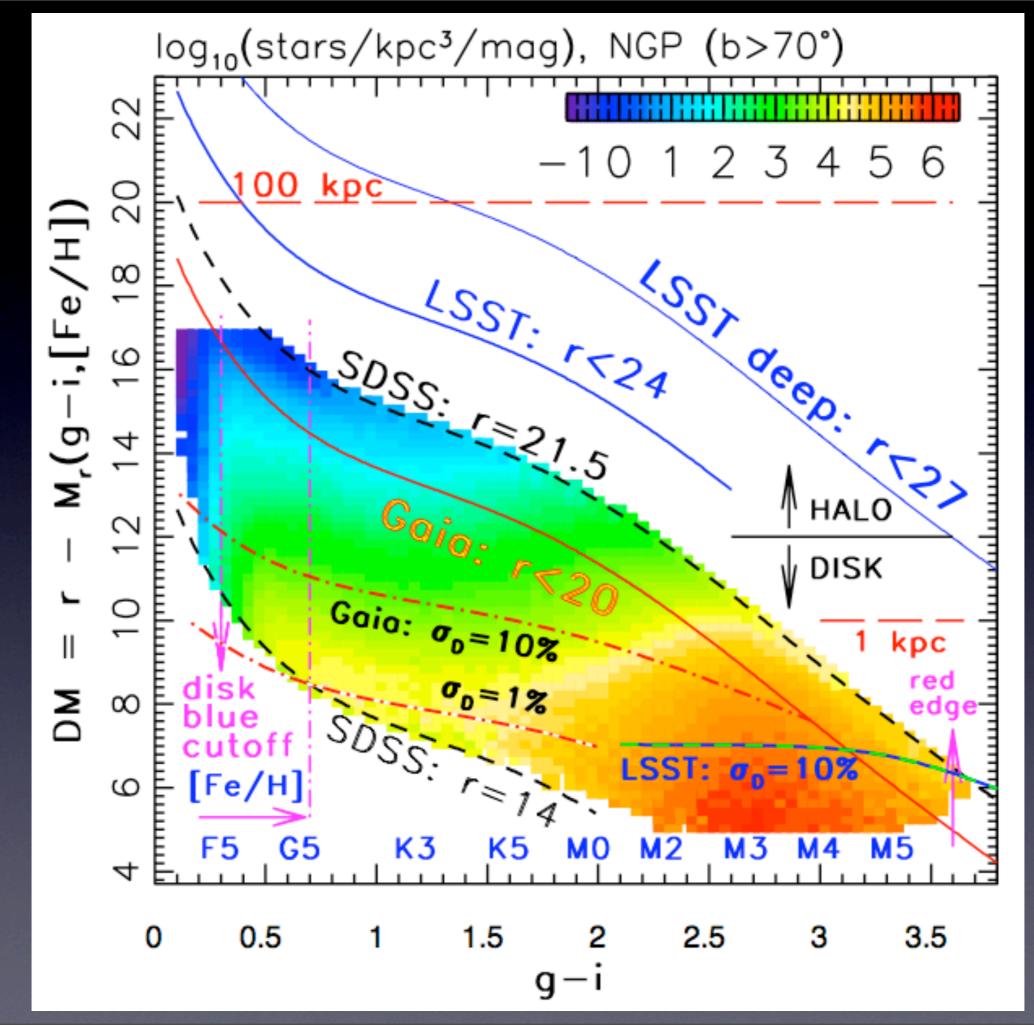

#### Gaia vs. LSST comparison•

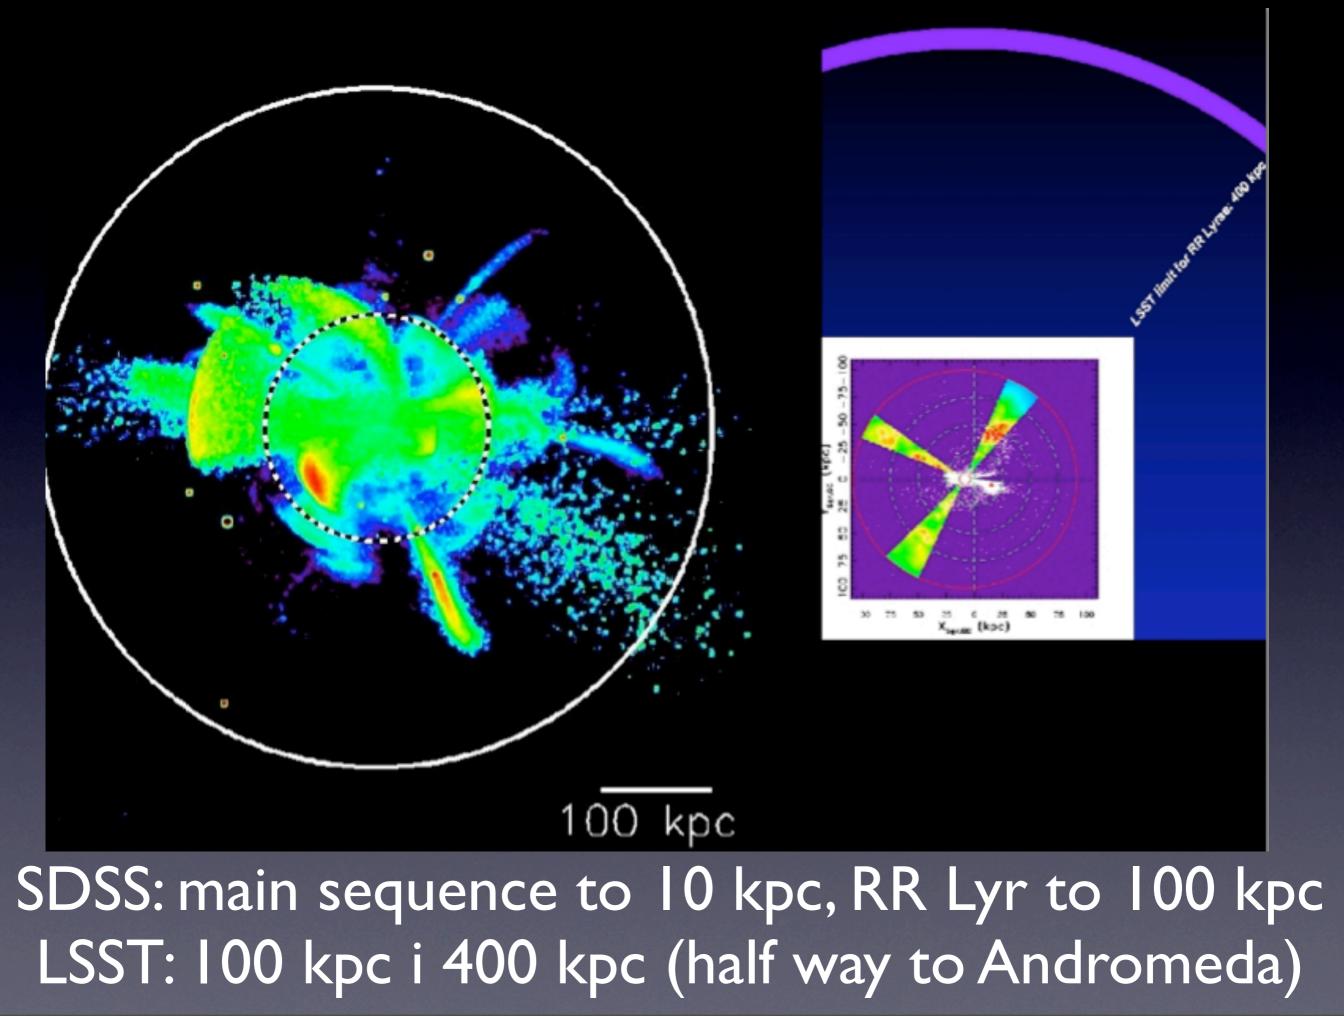

Gaia: excellent astrometry (and photometry), but only to r < 20

- LSST: photometry to r < 27.5 and time resolved measurements to r < 24.5
- Complementarity of the two surveys: photometric, proper motion and trigonometric parallax errors are similar around r=20

The Milky Way disk "belongs" to Gaia, and the halo to LSST (plus very faint and/or very red sources, such as white dwarfs and LT(Y) dwarfs).

#### LTY Dwarfs with LSST

- T dwarfs: a quantitative example (L dwarfs are dime a dozen: 200,000 in LSST with proper motion and trigonometric parallax measurements; no Y dwarfs are confirmed yet, though based on models expect ~100 from LSST)
- Simulations predict 2400 T dwarfs with y < 21.4 (now  $\sim 100$ )
- For y < 21.4 proper motion (σ = 2 mas/yr) and trigonometric parallax measurements (σ=6 mas) based on 200 y band detections: 5-10σ measurements even for the faintest objects
- The z y color will be accurate to better than 0.1 mag even for the faintest objects: it will be possible to construct robust  $M_z$  vs. z - y color-magnitude diagrams (exquisite LFs!)
- The y < 21.4 LSST T dwarf sample has roughly the same JHK magnitude limits as the UKIDSS Large Area Survey (4,000 deg<sup>2</sup>)
- Compared to UKIDSS, LSST will obtain about 5 times larger sample of T dwarfs, with proper motions about 10-20 times more accurate, and also with trigonometric parallax measurements (due to larger sky area, note that our simulations imply that UKIDSS will detect about 500 T dwarfs)
